1. INTRODUCTION

The purpose of this report is to provide a summary of site characterization and cleanup activities conducted at the Site which encompasses the former Journal American property located at 1625 132nd NE in Bellevue, Washington (King County parcel number 2825059191), the property located at 1700 130th Avenue in Bellevue (King County parcel number 2825059040), and the property located at 1606 130th Avenue NE in Bellevue, Washington (King County parcel number 2825059159). The Site comprises Washington State Department of Ecology (Ecology) Cleanup Site identification (ID) number 5149 and Facility Site ID number 2558. Figure 1 (attached) displays the location of the Site. Figure 2 displays the details of the Site.

On behalf of the City of Bellevue, Parametrix has prepared this VCP summary report on cleanup actions performed at the Site. The City is seeking a formal opinion of the cleanup actions in order to remove the remaining restrictive covenant on the property and achieve a no further action (NFA) status.

1.1 Site Location

The Site is identified by King County parcel numbers 2825059159, 2825059040, and 2825059191. The Site is located between 130th Avenue NE and 132nd Avenue NE and north of the Sound Transit East Link line which encompasses the former Spring Boulevard in Bellevue, Washington. The Sound Transit East Link Bel-Red Station is located adjacent south of the Site (Figures 1 and 2).

1.2 Physical Setting

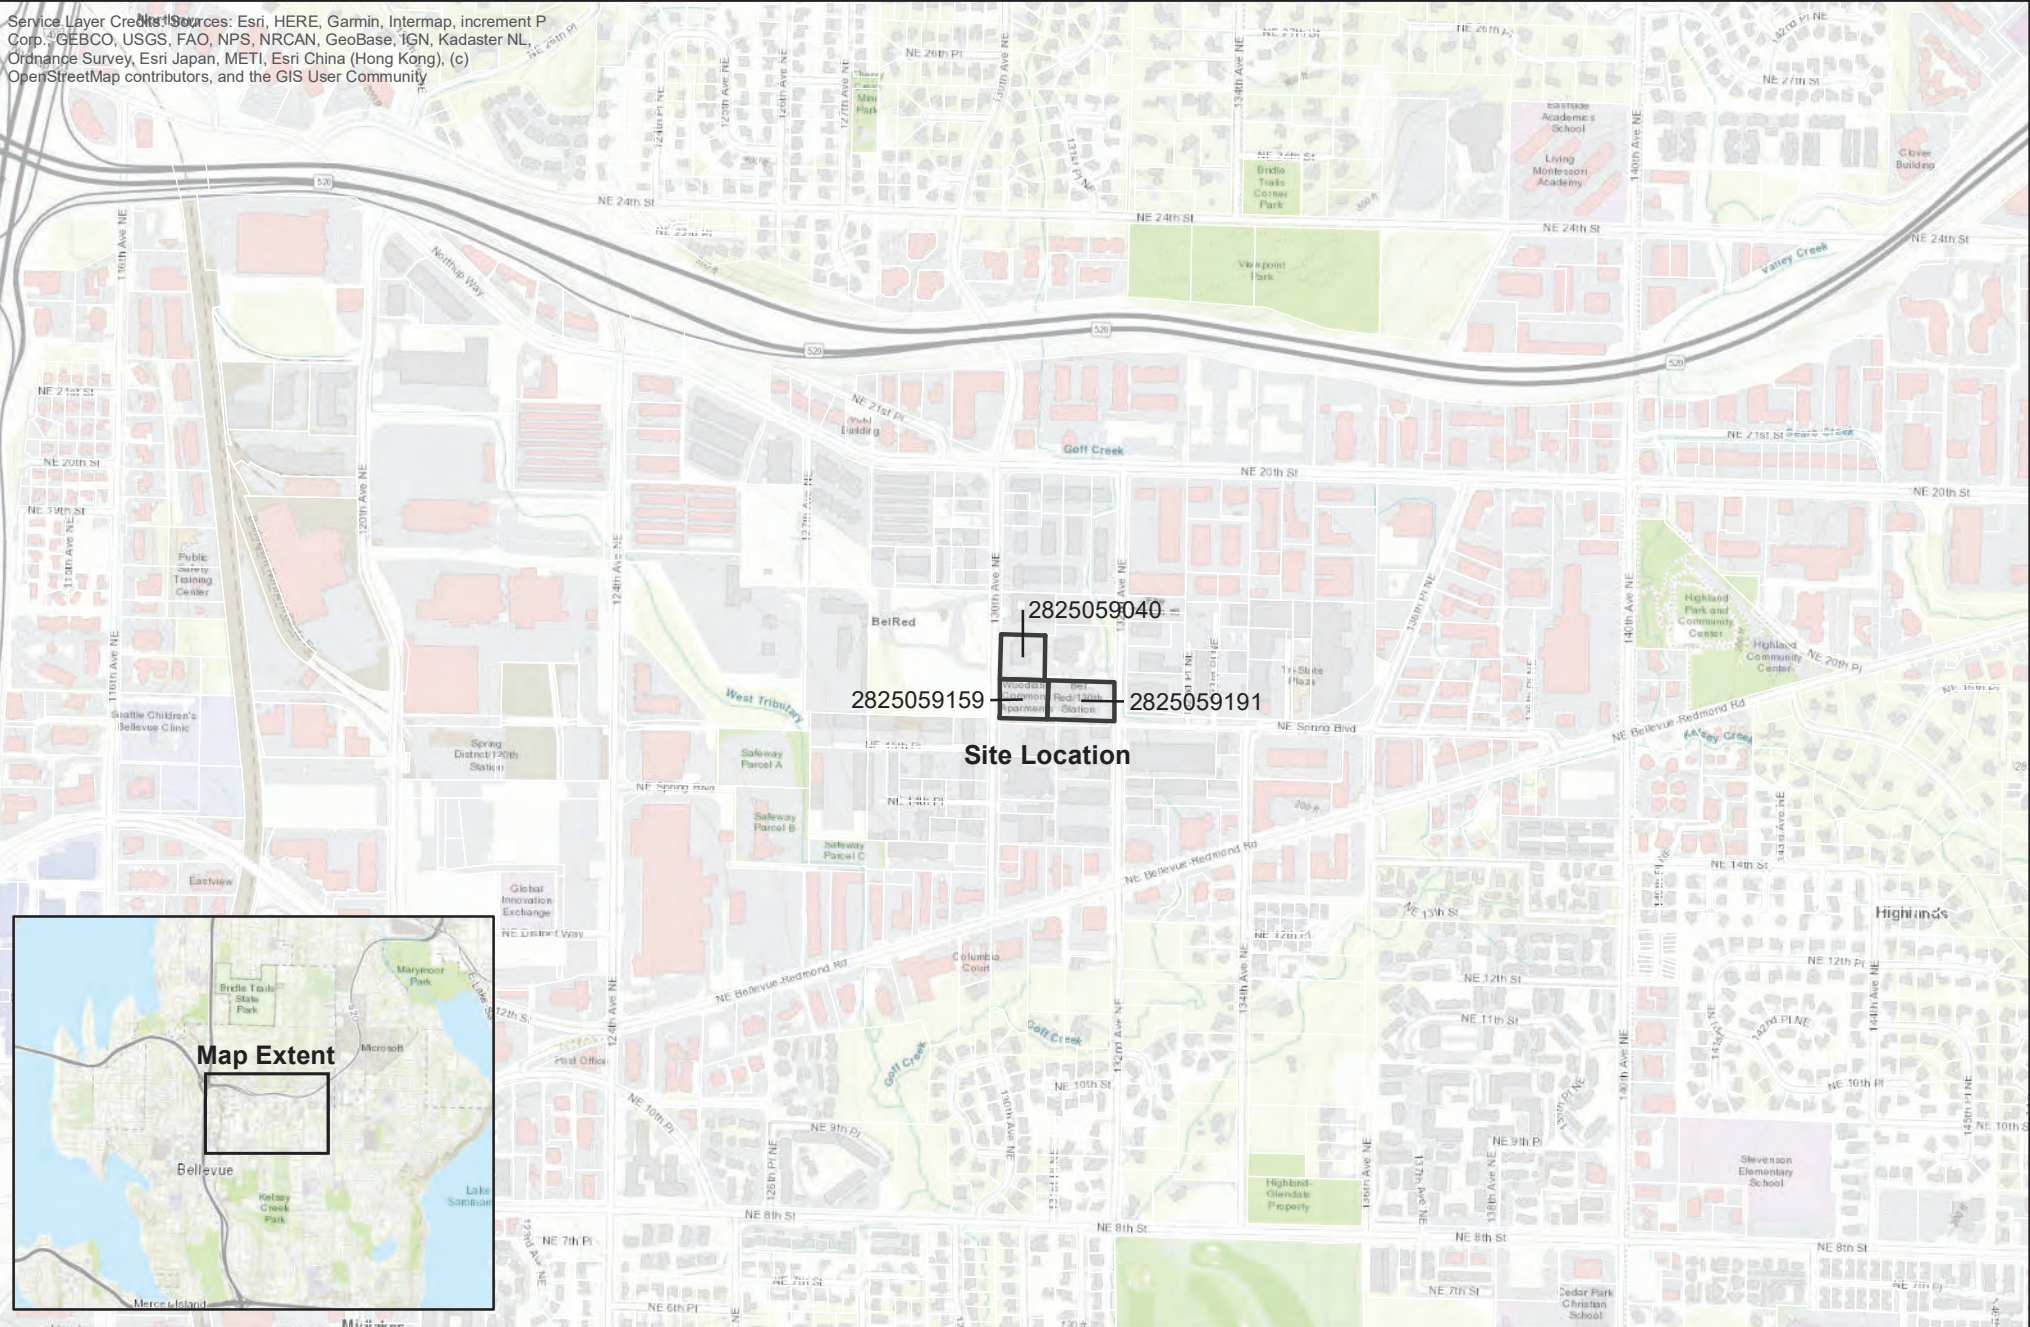

The Site is located within the Bel-Red neighborhood of Bellevue within the Northeast quarter of Section 28, Township 25 North, Range 5 East. The Site ranges in elevation from approximately 190 to 205 feet above sea level with a southerly slope (King County iMap 2020).

1.2.1 Soil and Geology

Soils in the area of the Site are mapped as Everett very gravelly sandy loam (NRCS 2020). These are described as somewhat excessively drained soils formed from glacial outwash deposits.

The surface geology of the Site is mapped as Quaternary Vashon recessional outwash (Qvr) deposits (Troost et al. 2006). The Qvr deposits are described as coarse to fine-grained sand and gravel deposits. The Qvr deposits were initially laid by outwash floodwaters during the northward recession of the Puget Lobe during the Vashon Stade of the Fraser Glaciation. Quaternary Vashon lacustrine silt (Qvrl) deposits are a finer grained subset of recessional outwash deposits, primarily composed of silty sands or silts related to outwash lake deposits during the recession of the Puget Lobe. No Qvrl deposits are mapped in the area, but the unit is overall related to the Qvr deposits. Qvr deposits are typically underlain by Quaternary Vashon till (Qvt) deposits. Qvt deposits primarily consist of compacted sand and gravel within a silt or clay matrix. Their compacted nature makes the Qvt deposits a regional low permeability confining layer, often creating a shallow perched aquifer within the Qvr deposits.

1.2.2 Groundwater

Shallow perched groundwater is approximately 5 to 15 feet below ground surface (bgs) with shallow soils being typical of Qvr or Qvrl deposits.

The gradient below the Site is interpreted to be primarily to the south-southeast, following the trajectory of Goff Creek. Goff Creek is located on the eastern boundary of the Site and flows to the south-southeast. However, there may also be a south-southwest gradient towards the West Tributary particularly on the western portion of the Site. The West Tributary is located 1,100 feet west of the Site.

1.3 Site History

The Site encompasses three parcels formerly occupied by the following structures:

- The northern parcel (285059040) was developed in 1977 with a one-story office and warehouse that had a mezzanine level. Airphone appears to have occupied the building from the time of development through approximately 2017. The building was demolished by Sound Transit in 2020.
- The southwest parcel (2825059159) was developed in 1962 with a single-story concrete block building. The building was primarily occupied by Stusser Electric through 2003, with several other businesses renting space from the 1970's through 2013. The building was demolished by Sound Transit in 2017.
- The southeast parcel (2852509191) was developed in 1969 and occupied by Ace Bulldozing. Two 5,000-gallon heating-oil underground storage tanks (USTs) were present on the northwest corner of the historical building. In 1983, Journal American developed a new press facility on the southeast parcel. The new facility used a fuel-dispensing UST below the southern portion of the press building within a maintenance bay area. The building was demolished in 2017 by Sound Transit.

The three parcels were used as a construction site and staging area for Sound Transit during the construction of the Bel-Red/130th Station adjacent south of the Site through November 2020. Sound Transit's use of the property included development of a street sweeping disposal pond, vehicle wheel wash, equipment storage, clearing, and grading of the Site.

1.4 Current Use

The Site is currently developed as a 300-stall parking lot for the Bel-Red/130th Station and is owned and operated by the City of Bellevue. The parking lot was constructed in 2022. The Sound Transit station is anticipated to be active in 2024.

2. PREVIOUS INVESTIGATIONS

2.1 Initial Discovery

In 1995, an Independent Remedial Action Report (IRAP) was completed on the Site related to three historical USTs that served the Journal American (CH2MHill 1995a). Two USTs were located north of the former Journal American press building and one was located to the south on parcel 2825059159. The two northern USTs were located on the adjacent parcel 1705 132nd Avenue NE and not on the Site.

Petroleum hydrocarbon-contaminated soils were discovered at both the northern and southern UST areas. Approximately 75 tons of petroleum contaminated soils (PCS) were excavated and removed from the northern UST area adjacent to the Site.

The southern UST area on the Site was primarily underneath the press building. Four monitoring wells and many boreholes were completed to determine the extent of contamination. Groundwater within the source area was initially found above the Model Toxics Control Act (MTCA) Method A cleanup levels (CULs) for gasoline, diesel, and xylenes. Approximately 40 tons of PCS was excavated and removed from south of the building with PCS remaining below the building. Following completion of the excavation, an asphalt cap was placed over the area in 1995.

A copy of the report is attached in Appendix A.

2.2 1995 – 1996 Groundwater Monitoring

Groundwater monitoring was performed in August 1995 (CH2M Hill 1995b), December 1995 (CH2M Hill 1996a), February 1996 (CH2M Hill 1996b), May 1996 (CH2M Hill 1996c), and August 1996 (CH2M Hill 1996d). The wells were located in the vicinity of the UST area and to the southeast and southwest. The groundwater monitoring results showed groundwater contamination in the vicinity of the southern UST area up to 1,170 µg/L gasoline, 1.2 µg/L benzene, 7.8 µg/L ethylbenzene, and 20.3 µg/L xylenes. Four quarters of monitoring was completed with results showing gasoline up to 550 µg/L and diesel up to 680 µg/L. After four quarters the monitoring wells were decommissioned. Copies of the reports are attached in Appendix B.

2.3 1996 Restrictive Covenant and No Further Action

Based on the results of the IRAP and placement of an asphalt cap in 1995, Ecology issued a NFA for the Site with a restrictive covenant (Ecology 1996). The covenant was based upon the PCS remaining below the footprint of the building. No vapor intrusion assessment was completed at the time of the NFA. A copy of the NFA with restrictive covenant is available on the Ecology cleanup site page. The restrictive covenant is attached in Appendix C.

2.4 2005 Release of Restrictive Covenant

Washington State Department of Ecology acknowledged that the Restrictive Covenant was erroneously recorded against the adjacent property at 1705 132nd Avenue, Bellevue, Washington, and consented to the Release of Restrictive Covenant for that parcel in 2005 (Ecology 2005). However, the Restrictive Covenant on the Site, 1625 132nd Avenue NE, Bellevue, Washington, remains in effect. A copy of this the release is attached in Appendix C.

2.5 2009 Periodic Review

In 2009 Ecology completed a periodic review of the Site (Ecology 2009a). The periodic review concluded that cleanup actions at the site appear protective of human health and the environment, soil cleanup levels had not been met at the standard point of compliance, and the restrictive covenant for the property continued to be effective. A copy of the 2009 periodic review is attached in Appendix C.

3. RECENT INVESTIGATIONS

3.1 2015 Phase I ESAs

Shannon and Wilson, Inc. completed three separate Phase I ESAs in 2015 for the Site related to potential acquisition of the Site by Sound Transit (Shannon and Wilson, Inc. 2015a, 2015b, 2015c). The Phase I ESAs were provided to Parametrix for the 2017 Environmental Evaluation, and copies of the reports are attached below in Appendix D.

3.2 2015 Phase II ESA

Shannon and Wilson, Inc. completed a Phase II ESA on the southwest portion of the Site (Shannon and Wilson, Inc. 2015d). Four boreholes were completed, one borehole on each corner of Parcel 2825059159. Soil and groundwater samples were collected from the boreholes. A copy of this report is attached in Appendix D. Results are discussed below.

3.2.1 Results

Soil Results:

- Gasoline-, lube oil-, and diesel-range petroleum hydrocarbons were detected among soil samples from EL296-1 and EL296-3, though all under MTCA Method A CULs.
- VOCS, metals, and PAHs were detected in soil below their respective MTCA Method A CULs.
- PCBs were not detected in soil.

Groundwater Results:

- Total metals (arsenic, chromium, and lead) were detected and exceeded MTCA Method A CULs at EL296-4. Total metals were detected below CULs at EL296-3. No dissolved metals were detected in EL296-1 or EL296-2.
- VOCs were detected below MTCA Method A CULs.
- No petroleum hydrocarbons were detected in any of the groundwater samples.

Based on the results of the 2015 Phase II ESA, Shannon and Wilson determined that groundwater contamination may have resulted from a surface spill, and metals concentrations may have been from elevated turbidity related to geoprobe sampling. They recommended Site workers should be informed of potential exposure if construction work is anticipated, and special handling of the soil and groundwater may be necessary for off-site disposal.

3.3 2017 Environmental Evaluation

An environmental evaluation (document review) was conducted on the Site by Parametrix in July 2017 (Parametrix 2017). This information revealed:

- Potential soil impacts to the Site were relatively minimal, except for the southeastern parcel (2825059191) which had an estimated 430 cubic yards of petroleum-impacted soil near the southern portion of the former building related to a documented historical release.
- Groundwater below the Site had been impacted by on-site or off-site issues, specifically on the southeast portion of the Site on parcel 2825059191, with potential minor impacts to the southwest portion of the Site on parcel 2825059159.
- There were relatively little data to support that all impacts to the Site had been identified and/or sufficiently addressed (or planned to be addressed). The report noted that the potential for significant impacts to the Site beyond the southeastern portion was relatively low and recommended a Phase II ESA be completed to determine soil and groundwater conditions below the Site.

A copy of the 2017 Environmental Evaluation report is attached in Appendix E.

3.4 2018 Phase II ESA

In August 2017, Parametrix oversaw the drilling of 20 environmental boreholes to evaluate soil and groundwater conditions below the Site (Parametrix 2018). Multiple soil samples were collected from each borehole, and groundwater samples were collected from eight locations. Soil and groundwater samples were primarily analyzed for petroleum hydrocarbons, with some samples submitted for volatile organic compounds (VOCs), semi-volatile organic compounds (sVOCs), carcinogenic polycyclic aromatic hydrocarbons (cPAHs), and metals.

3.4.1 Results

Soil Results:

- Diesel and oil-range total petroleum hydrocarbons (TPH) were identified in soil above MTCA Method A CULs at one location, B-15, located on the eastern portion of the Site.
- Gas-range TPH was found at the MTCA Method A CUL of 100 mg/kg at one location, B-17, near the former release area. Benzene was not identified in the sample. Gas-range TPH was found at 32 mg/kg at location B-15.
- No detections of benzene, toluene, ethylbenzene, and xylenes (BTEX), other VOCs, metals, or cPAHs were detected in the sample from B-15.

Groundwater Results:

- Diesel and oil-range TPH were identified in groundwater from at two locations above MTCA Method A CULs, B-15 on the eastern portion of the Site, and B-11 on the southwest portion of the Site.
- VOCs, cPAHs, and metals except for arsenic were all found below applicable MTCA Method A CULs.

- Two of the groundwater samples (B-15 and B-18) had concentrations of arsenic above MTCA Method A CULs; however, these concentrations were determined to be likely related to turbidity in the samples rather than leaching from an on-site source.

Based on the results of the 2018 Phase II ESA, Parametrix recommended excavations to remove source areas of soil contamination discovered at the Site and to develop mitigation and monitoring efforts to facilitate redevelopment.

The full report for the 2018 Phase II ESA with a more thorough review of the results is attached below in Appendix E.

3.5 2019 Excavation

In 2018, Ecology was notified of Sound Transit's plan to excavate contaminated soil from the Site in accordance with notification requirements of the Restrictive Covenant.

In 2019, KLB Construction excavated contaminated soil below the Site. Innovex Environmental Management Inc. (Innovex) completed characterization and soil confirmation sampling during the excavation (Innovex 2019).

Four areas of the Site previously identified by the 2018 Phase II ESA (Parametrix 2018) and historical release areas were excavated at depths ranging from 8 to 18 feet bgs. A total of 34 confirmation soil samples were collected for laboratory analysis from the four excavations, including sidewall and pit bottom samples. A total of approximately 223 tons of PCS was excavated and disposed off-site. Soil confirmation samples from the four areas showed low-level detections of diesel- and oil-range TPH at concentrations below MTCA Method A CULs. The highest concentration remaining in place was diesel-range TPH up to 860 mg/kg at Area 1, and oil-range TPH up to 800 mg/kg at Area 3 (Figure 2). There were no detections of gasoline in the confirmation samples remaining at the Site. No groundwater was reportedly encountered or investigated.

A copy of the report summarizing this excavation event is attached as Appendix F.

Additionally, during development of the Bel-Red Station, Sound Transit installed new power and communication lines along the Southern portion of the Site. The power and communication lines were placed directly over the top of the southern portion of Area 1 and over Area 3 (Figure 2) where the diesel- and oil-range TPH up to 860-800 mg/kg and groundwater at B-11 up to 1,030 µg/L was previously identified. It is unknown if these soils were removed during placement of the utilities or any groundwater pumping and treatment was completed.

3.6 2020 Phase II ESA

Parametrix completed a Phase II ESA (Parametrix 2020) of the Site related to the City of Bellevue's acquisition of the parcels from Sound Transit. The goal of the 2020 Phase II ESA was to both evaluate conditions from Sound Transit's use of the property from the previous 2018 Phase II ESA through 2020 as well as to understand the conditions below the Site related to the historical release and cleanup completed by Sound Transit. A copy of the 2020 Phase II ESA is attached in Appendix G.

Parametrix observed the drilling of eight boreholes across the Site. The boreholes were spaced to allow three locations on each of the southern parcels and two locations on the northern parcel and were adjusted to allow Sound Transit to continue to operate on the property and to prevent striking newly placed utilities. One soil sample and one groundwater sample were collected from each borehole. Soil

samples were selected based upon field screening with a photoionization detector and soil observations (smear zone, etc).

3.6.1 Results

Samples were analyzed for TPH and BTEX.

Soil Results:

- No gasoline- or diesel-range TPH or BTEX were detected in any of the samples.
- Oil-range TPH was detected in three samples (57 to 660 mg/kg), below the applicable MTCA Method A CUL for oil-range TPH in soil.

Groundwater Results:

- No detections of gasoline- and diesel-range TPH or BTEX in any of the samples.
- Oil-range TPH was detected in five samples ranging from 230 to 440 µg/L below the MTCA Method A CUL for oil-range TPH in groundwater.

The results were consistent with previous oil-range TPH results, and may be related including small spills related to Sound Transit's use of the property as well as historical releases to the Site.

Boreholes placed in the vicinity of the known historical releases found no soil contamination.

Groundwater results appeared to generally show that the excavation of the historical releases completed by Sound Transit was effective.

3.7 2021 Site Development

In August 2021 during Site redevelopment, the City of Bellevue encountered an area of suspect contamination on the Site (City of Bellevue 2021). Approximately 150 tons of soil was excavated and disposed off-site at Waste Management. Testing of the suspect contamination found concentrations of TPH diesel and oil of up to 1,490 mg/kg, below MTCA Method A CULs. No gasoline-range TPH or associated VOCs were identified.

There is no report for this event; however, all documents related to this Site development, the suspect contamination, and the respective excavation are attached in Appendix H.

4. CONCEPTUAL SITE MODEL

A conceptual site model was developed for the Site using the subsurface geologic information from previous investigations as well as the laboratory results.

4.1 Hydrogeologic Cross Sections

Two cross sections were developed showing the hydrogeology of the Site. Figure 3 attached shows the location of the cross sections. Figure 4 displays A-A' cross section of the north-south profile across the western portion of the Site. Figure 5 displays the B-B' cross section of the west-east profile across the southern portion of the Site.

- The Site slopes from north to south from elevation 203 down to 184 feet above sea level.
- The thickness of fill deposits varies across the Site prior to encountering native deposits
- Sand, silty sand, and sand and gravel are immediately below the fill and comprise the Vashon recessional outwash
- Siltier sands and silts are located further below.
- No till was encountered but is anticipated further at depth.
- The groundwater elevations range from approximately 194 feet above sea level to 184 feet above sea level (5 to 15 feet bgs) with a predominantly north to south gradient.

4.2 Nature and Extent and Remediation of the Historical Releases

Based upon the previous and recent investigations, there have been three forms of releases or suspect releases at the Site:

- Petroleum contaminated soil related to the UST area
- Small spills and releases of oil-range TPH from historical and recent uses

Additionally, based upon the previous and recent investigations, the following is known:

- Petroleum contaminated soil was excavated adjacent north of the Site related to the North UST area that served the Journal American property.
- No tetrachloroethylene, trichloroethylene, cis-1,2-dichloroethylene, or vinyl chloride were detected in the five groundwater samples from the 2018 Phase II ESA.
- Previously TCE was identified up to 1.2 µg/L on the northeast portion of EL-297.

4.2.1 UST Area

The historical soil contamination related to the UST area was excavated and removed by Sound Transit in 2019 (Figure 2). Soil and groundwater investigations following removal of the contaminated soil removal have shown no remaining impacts related to the UST area. Groundwater monitoring historically completed downgradient of the UST area also showed no impacts to groundwater. Based on the remediation and length of time since the release, minimal Site impacts below MTCA Method A CULs remain related to releases from the UST area.

Document Path: L:\VPCO\Projects\Clients\1580-City of Bellevue\553-1580-081 BelRed_2020 Ph II ESA\955rc\GIS\Mapdocs\Fig2_BelRed_SiteDetail.mxd

4.2.2 Small Spills

In 2020, small spills of oil related to Sound Transit equipment were observed throughout the property during the Phase II ESA. Small spills related to historical activities such as spill of oil-range TPH from the press room may also have occurred. A spill of predominantly oil-range TPH was remediated by Bellevue in 2021 (Figure 2) at the northeast corner of the Site.

Soil and groundwater concentrations from the 2020 Phase II ESA show levels consistently below MTCA Method A CULs indicating further investigations are not necessary.

4.3 Cleanup Standards

MTCA Method A CULs were utilized to determine cleanup standards for chemicals of concern at the Site in soil and groundwater. MTCA Method B screening levels were utilized to determine screening levels to evaluate vapor intrusion issues at the Site. Table 1 summarizes the cleanup standards and screening levels for the Site.

Table 1. Cleanup Standards and Screening Levels for Chemicals of Concern

Chemical of Concern	Soil Cleanup Level (mg/kg)	Groundwater Cleanup Level (µg/L)	Soil VI Screening Level (mg/kg)*	Groundwater VI Screening Level (µg/L)
Gasoline TPH	30 / 100	800 / 1000	100	30,000
Diesel-range TPH	2,000	500	250	30,000
Oil-range TPH	2,000	500	250	30,000
Benzene	0.03	5	<10	2.4
Toluene	7	1,000	NA	15,000
Ethylbenzene	6	700	NA	2,800
Xylenes	9	1,000	NA	320
Naphthalene	5	160	NA	8.8

*Requires a minimum vertical separation from buildings of 6 feet.

NA Not Available (Ecology 2009; Ecology 2023)

4.4 Current Site Conditions

4.4.1 Soil

Table 2 summarizes the known concentrations of contaminants remaining in place in soil.

Table 2. Known Concentrations of Contaminants Remaining in Place in Soil

Location ID	Sample Depth (ft)	Chemical of Concern	Soil Concentration (mg/kg)
2018 B1	11	Oil-range TPH	90
2019 Area 1	8 to 14	Diesel-range TPH	32 to 860
2019 Area 3	8	Oil-range TPH	800
2020 B22	6	Oil-range TPH	57

Location ID	Sample Depth (ft)	Chemical of Concern	Soil Concentration (mg/kg)
2020 B 24	2	Oil-range TPH	660
2020 B27	5.5	Oil-range TPH	100

As shown in the table, known contaminants remaining in place are predominantly oil-range TPH at concentrations below the MTCA Method A CUL of 2,000 mg/kg, and few values are above the screening level for petroleum vapor intrusion (PVI) of 250 mg/kg. Historical gasoline-range TPH related to the release from the USTs has been remediated and is no longer present. The PCS in the 2019 Areas may have been removed during installation of new power and communication lines by Sound Transit (Figure 2) or remain in place and would not be disturbed by future site development.

4.4.2 Groundwater

Table 3 summarizes recent groundwater concentrations observed at the Site in 2020.

Table 3. Recent Concentrations of TPH in Groundwater

Location ID	Chemical of Concern	Sample Result (µg/L)
B11	Diesel and Oil-range TPH	1,030
B25	Oil-range TPH	400 to 440
B26	Oil-range TPH	250
B27	Oil-range TPH	410
B28	Oil-range TPH	230

Previously groundwater was found at B11 up to 1,030 µg/L in 2018 for diesel- and oil-range TPH. However, location B-21 completed in 2020 adjacent to the location was non-detect for diesel-and oil-range TPH. Historical quarterly groundwater monitoring at the Site found gasoline and diesel range contamination related to the southern UST area. However, no gasoline-range TPH was identified in 28 boreholes completed across the Site in 2018 and 2020. Additionally, diesel-range TPH was non-detect in the 2020 Phase II sampling. These results indicate historical concentrations have likely been remediated by the soil removal projects (including utility improvements) as well as by natural attenuation during the 28 years since initial discovery. None of the groundwater concentrations from recent results are above the PVI screening level.

4.4.2.1 Surface Water

The no environmental effects-based concentrations (NOEC) for TPH-Dx/Oil is 150 µg/L (Ecology, 2018). Concentrations in groundwater at the Site are above this screening level; however, all areas of the eastern portion of the Site are located downgradient of Goff Creek. Goff Creek enters a culvert below 132nd Avenue NE on the northeast corner of parcel 2825059191 and does not daylight until 900 feet south at Bel-Red road and there is no direct pathway.

4.4.3 Vapor

No air samples were taken on the Site, thus no tier 2 vapor intrusion (VI) analysis was conducted. In lieu of a vapor study, a tier 1 VI analysis was performed, comparing the soil and groundwater samples to Ecology's PVI guidance (Ecology 2009b) and MTCA screening levels for vapor intrusion.

TPH-oil levels for all soil borehole samples measured below Method A CULs; however, one sample taken at boring B24 at a depth of 2 feet measured above the PVI guidance's soil screening level of 250 mg/kg. Sidewall and bottom samples from the 2019 excavation were identified up to 860 mg/kg of diesel-range TPH at Area 1 and up to 800 mg/kg of oil-range TPH at Area 3.

The primary contaminant of concern related to diesel and oil-range TPH is the semi-volatile naphthalene. Naphthalene is typically 0-1% in diesel-range TPH and 0.1 to 3% of heavy fuel oil-range TPH components. Based on the concentrations found at the Site naphthalene is anticipated to be below the VI screening level in soil of 2.5 mg/kg and in groundwater of 8.8 µg/L. Previous results in groundwater were less than 0.093 µg/L (Parametrix 2018; Phase II ESA). Naphthalene in soil was found up to 310 mg/kg at location B-15 in 2018. However, this area has since been remediated by both Sound

Transit (2019) and the City of Bellevue (2021) excavations. Based on the limited concentrations of TPH in soil and groundwater below CULs, VI is not anticipated to be an issue.

5. TERRESTRIAL ECOLOGICAL EVALUATION

The Site qualifies for a simplified Terrestrial Ecological Evaluation (TEE) criteria WAC 173-340-7492. The Site is currently covered by pavement that will prevent plants or wildlife from being exposed to any possible remaining soil contamination. There is less than 1 acre of adjacent undeveloped habitat with moderate quality. A completed TEE form and MTCA Table 749-1 calculations are attached in the Appendix I.

6. SUMMARY

6.1 Conclusions

The Site includes the former Journal American property located at 1625 132nd Avenue NE in Bellevue, Washington which had historical contamination related to a USTs. The Site also includes two adjacent properties at 1606 and 1700 130th Avenue NE in Bellevue (Figure 2). The Site is identified as Ecology Cleanup Site ID 5149 and Facility Site ID 2558.

The following characterization and remedial actions have been conducted at the Site:

1. An IRAP was completed in 1995. Forty tons of PCS were excavated and an asphalt cap was placed over the area. Contaminated soil remained in place under a building.
2. Four quarters of groundwater monitoring were completed in 1995-1996.
3. In 1996, the Site achieved a NFA with a restrictive covenant, and Ecology later consented to a Release of Restrictive Covenant in 2005 for a portion of the Site at 1705 132nd Avenue, Bellevue, Washington. A restrictive covenant remains at 1625 132nd Avenue NE, Bellevue, Washington.
4. A 2017 environmental review, which included reviewing multiple Phase I and Phase II ESAs in 2015 completed by Shannon & Wilson, confirmed the presence of PCS on the southern portion of the Site and that groundwater had been impacted.
5. A Phase II ESA conducted by Parametrix in 2018 confirmed soil and groundwater below the Site above MTCA Method A CULs related to historical and unknown releases.
6. In 2019, approximately 223 tons of PCS was excavated and disposed off-site by Sound Transit. Soil confirmation samples showed levels below MTCA Method A CULs.
7. In 2020, Parametrix completed an additional Phase II ESA during the City's acquisition of the Site confirming remaining impacts of TPH in soil and groundwater were below MTCA CULs.
8. In 2021, approximately 29.45 tons of PCS were excavated and disposed off-site and analytical results were below MTCA A CULs. This was in the same area identified by the 2018 Phase II ESA on the northeast corner.

As the Site currently stands, there are minimal risks and levels of petroleum contamination in soil remaining in place are below applicable MTCA Method A CULs. Levels of petroleum hydrocarbons in groundwater remaining in place are anticipated to be below applicable MTCA Method A CULs based upon the most recent investigation in 2020. The current Site conditions show that areas of historical

releases related to the restrictive covenant have been properly remediated. Additional areas of contamination were identified and excavated during site redevelopment.

Vapor intrusion evaluations have not previously been completed. Based on the primary carcinogen of diesel- and oil-range TPH being naphthalene and the results of historical naphthalene evaluations at the Site, the PVI risk is considered low.

A simplified TEE was completed showing no risk of soil impacts to biological receptors. Additionally, groundwater to surface water pathway was evaluated and determined to not be complete.

1 Introduction

This Independent Remedial Action Report (IRAR) describes the results of the soil and groundwater investigations completed at The Journal American facility in Bellevue, Washington. This investigation has been conducted for Persis Corporation, the former owner of the property, by CH2M HILL. This IRAR has been completed in accordance with the Washington Department of Ecology (Ecology) Guidance on Preparing Independent Remedial Action Reports Under the Model Toxics Control Act (MTCA), Chapter 70.105D RCW (DRAFT, March 1, 1994).

2 Executive Summary

The Journal American is an operating newspaper printing and publishing facility located at 1705 132nd Avenue NE, Bellevue, King County, Washington. The vicinity of The Journal American facility and the facility layout are shown in Figures 1 and 2, respectively. Prior to the construction of the newspaper publishing facility, the site was occupied by Whitescarver Brothers Trucking and the Ace Bulldozing Company. The existing press building (southern building) was constructed in 1983 on the portion of the site historically used by the trucking and bulldozing companies.

Petroleum hydrocarbon contaminated soils (gasoline and diesel) were encountered at The Journal American facility in the vicinity of two decommissioned underground fuel storage tank areas and an associated fuel dispensing island. One underground storage tank area is north of the press building (north underground storage tank). This area consisted of two 5,000-gallon gasoline storage tanks. The other tank area is located south of the press building (south underground storage tank); this area consisted of a single tank. The fuel dispensing island for this tank was located beneath the press building in the area of the current maintenance bay. Figure 3 shows the former tank locations and the areas of investigation.

Initially, 12 borings and one test pit were completed to investigate soils in the area of the two former underground storage tank farms (north and south of the press building). In addition, four shallow soil borings were completed around the printing press. Figure 4 identifies the initial soil boring and test pit locations.

Sample results from the initial borings and test pit detected petroleum-related contamination in soils in the vicinity of both the decommissioned tank locations. Approximately 75 tons of petroleum hydrocarbon contaminated soil was removed from the north underground storage tank area and taken to Regional Disposal Company for disposal at a (Resource Conservation and Recovery Act (RCRA) Subtitle D) landfill. Soil samples collected from the sidewalls and bottom of the soil excavation confirmed the removal of the contamination. No additional investigation or remedial action in the vicinity of the north underground storage tank area is planned.

Four groundwater monitoring wells were installed in the vicinity of the former south underground storage tank to determine the possible presence of petroleum-related products in the site groundwater. A groundwater monitoring program was implemented because analysis of a non-water quality reconnaissance water sample taken from an open borehole in the press building detected petroleum-related parameters for gasoline, diesel, and xylene in excess of the MTCA Method A cleanup level for groundwater (TPH-G). However, monthly groundwater sampling events conducted from September 1994 (date of well installation) through February 1995 detected no petroleum-related contaminant constituents in site groundwater in concentrations that approach or exceed MTCA Method A cleanup levels.

Sixty subsequent soil borings were completed within the press building and the area south of the press building to further delineate the horizontal and vertical depth of the petroleum hydrocarbon contamination detected in the south underground storage tank area. Approximately 40 tons of petroleum-contaminated soil was removed from the area immediately south of the press building in the vicinity of the former underground storage tank. Additional soil removal in this area was not possible because of concerns regarding the structural stability of the press building foundation wall by the excavation.

The majority of the remaining petroleum hydrocarbon contamination (approximately 430 cubic yards) associated with the south underground storage tank is located beneath the press building. Additional soil removal of contaminated soil is not possible at this time because of the potential impacts to the structural integrity of the press building and the operational constraints associated with publishing and distribution of The Journal American newspaper. Upon issuance of a No Further Action determination by Ecology, a 4-inch asphalt cap will be placed over the parking lot south of the press building to effectively "cap" the contamination left in place. Given that the continuing source of the contamination (the underground storage tank) was removed some time prior to construction of the press building in 1983 and that groundwater contamination is not present above cleanup levels after 12 years of presence in the soil, the cap is anticipated to be an effective containment measure.

3 Location

3.1 Site Name

The Journal American

3.2 Street Address

1705 132nd Avenue NE
Bellevue, Washington 98005

3.3 Telephone Number

206/453-4619

3.4 Map of Site Location

The vicinity of The Journal American facility and the surface topography as indicated on the Kirkland USGS Quadrangle Map, dated 1950 and photo-revised 1968, are presented in Figure 1.

4 Topography and Geology

4.1 Detailed Site Maps

The Journal American facility is located at 1705 132nd Avenue NE, Bellevue, King County, Washington. Figure 1 is a site vicinity map showing regional topography and the site in Section 28, Township 25 North, Range 5 East, of Kirkland USGS Quadrangle Map dated 1950 and photo-revised 1968. The facility is situated on approximately 4.5 acres that are entirely covered by two buildings, asphalt parking lots, access drives, and landscaping as shown in Figure 2. The topography is predominately flat with an approximate 5 to 6 foot change in grade between the north and south buildings. Figure 2 also shows the property boundaries and surface structures at the site. The two buildings house the main office and photographic production and development departments (the main newspaper office building) and the printing press, newspaper assembly, paper storage, maintenance bays, and general office areas (the press building). Figure 3, a base reference map of the press building, indicates areas of investigation at the site.

Soil sampling locations from site investigation activities are shown in Figures 4 and 5. The areal extent of gasoline-contaminated soil in the area of the south underground storage tank is depicted in Figure 6; the areal extent of diesel-contaminated soil is depicted in Figure 7. Figures 8 and 9 depict the subsurface gasoline- and diesel-contaminated soil. Groundwater monitoring well locations in the area of the south underground storage tank and the site groundwater flow gradient are shown in Figure 10. Figure 11 is a cross sectional view of excavation slopes relative to the press building foundation. No subsurface structures such as utility lines, piping systems or caverns were encountered that were relevant to the site conditions.

4.2 Site Soil Types

Soil borings conducted at the site encountered silty to poorly graded sands, silt, and poorly graded sand with gravel. Structural fill material (poorly graded sand with gravel) was encountered in borings in the vicinity of the fuel dispensing island and the south underground storage tank as well as at other locations, most likely as a general site fill for site grading purposes.

Soil samples were described in accordance with ASTM Method 2488 Standard Practice for Description and Identification of Soil (Visual Manual Procedure). The native soils below the fill material included dense silty to poorly graded sands and silt. The generalized lithology

can be said to be dominated by water-bearing units of interbedded nonplastic silt and sand. Soil boring logs are included in Appendix A.

4.3 Other Site Information

The property is currently owned and operated by Northwest Media (Washington), L.P. under the name of The Journal American. The property has been used for newspaper publishing and commercial printing since 1976 when the main office building (northern building) was constructed. Originally, the site operated under the name of Longview Publishing Company. Prior to the construction of the newspaper publishing facility, the site was occupied by Whitescarver Brothers Trucking and the Ace Bulldozing Company. The existing press building (southern building) was constructed in 1983 on the portion of the site historically used by the trucking and bulldozing companies.

5 Release Information and Site Characterization

5.1 Spills and Releases

There is no known documentation related to the release of petroleum hydrocarbons to soil at the site. Petroleum hydrocarbon contamination was discovered in the vicinity of two former underground storage tank areas. The north underground storage tank area consisted of two 5,000-gallon tanks that reportedly contained unleaded and leaded gasoline. The tanks were decommissioned by the Longview Publishing Company in 1989. Records regarding the decommissioning made no reference to releases or spills from the tanks.

The south underground storage tank and fuel dispensing island were reportedly removed in 1983 when the press building was constructed. No records of the tank removal were discovered during the course of the site investigation. The depth at which petroleum hydrocarbons were encountered in the south tank area (approximately 7 to 12 feet below ground surface [bgs]) appears to be consistent with the depth of the underground storage tank and fuel dispensing island. The highest levels of detected contaminants were encountered in the immediate area of the fuel dispensing island. It is possible that the source of the contamination was leaks in the piping from the pump island to the storage tank or from overfilling of vehicles at the pump island.

5.2 Contaminants of Concern

The contaminants of concern were identified through a chemical analysis of soils collected in the three areas of investigation. The primary contaminants of concern for the site are total petroleum hydrocarbons (TPH) measured as gasoline, diesel, and heavy petroleum. Groundwater samples were also analyzed for benzene, toluene, ethylbenzene, and total xylenes (BTEX) constituents to conform with Ecology MTCA guidance for site investigations associated with underground storage tanks containing petroleum products.

5.3 Areal and Vertical Extent of Contamination and Media Affected

5.3.1 Soil

The areal extent of contamination, based on subsurface sampling in the vicinity of the south underground storage tank, is shown in Figures 6 and 7. Figures 8 and 9 show the subsurface gasoline- and diesel-contaminated soil. The contamination appears to be confined from 7 to 12 feet below existing ground surface. Historical site maps and architectural drawings for the press building indicate that the original site grades in the vicinity of the south underground storage tank were approximately 5 to 7 feet below existing grades. Soil analytical results are presented in Tables 3, 5, 6, and 9. Laboratory analytical data is provided in Appendix B. Soil contamination at the site is believed to have been present onsite since some time prior to 1983 when the press building was constructed and the underground storage tank was removed. Section 10 describes the results of soil sampling data documenting the contamination.

5.3.2 Groundwater

Four groundwater monitoring wells were installed in September 1994 to determine whether petroleum-related products were present in groundwater at the site. Sampling was conducted monthly from September 1994 through February 1995. None of the analytical results from these monitoring wells exceed MTCA Method A cleanup criteria for groundwater. Groundwater analytical results for each monthly sampling round are presented in Table 10. The groundwater monitoring program is described in greater detail in Section 11. Laboratory analytical data is provided in Appendix B.

5.3.3 Air

Soil contaminated with petroleum hydrocarbons is not exposed to air at The Journal American site. The remaining contaminated soil is located beneath the concrete floor of the press building, the concrete loading dock, and the asphalt parking area south of the press building. The floor and pavement in these areas is undamaged and in good condition. Therefore, air does not appear to be an affected environmental media and was not addressed in this investigation.

5.3.4 Surface Water

No perennial or ephemeral surface water bodies exist onsite. The closest surface water body is Lake Bellevue (formerly Sturdevant Lake), which is approximately one-half mile from the facility. The nearest surface water is Goff Creek, which flows into Kelsey Creek before joining the Mercer Slough. Goff Creek touches the northeast corner of The Journal American property before entering a culvert beneath 132nd Avenue NE. Because the petroleum hydrocarbon contaminated soil is not exposed to precipitation and the groundwater appears to be unaffected, there does not appear to be a pathway for contamination to surface water.

5.4 Sensitive Species or Environments Threatened by Release

There are no known sensitive species or environments that could be threatened by the petroleum hydrocarbon contamination at The Journal American site. A Washington Department of Fish and Wildlife database search reported no mapped occurrences of special status species at the site.

5.5 Known Potential Threats to Public Health

There do not appear to be any known potential threats to public health because contaminated soils have either been removed or are contained beneath the press building, loading dock, and asphalt parking area. This containment effectively precludes human contact with remaining contaminated soils. In addition, contaminants of concern were not detected in groundwater above MTCA Method A cleanup levels; therefore, groundwater does not appear to be a potential pathway for contaminants.

6 Previous Investigations

There are no known previous soil or groundwater investigations beyond those documented in this report.

7 Selection of Cleanup Standards

7.1 Cleanup Levels Selected

7.1.1 Soils

North Underground Storage Tank. Soils in the area of the north underground storage tank were analyzed for TPH-G, TPH-D, and TPH-O based on the historical use of petroleum products in the area. Soils with concentrations of TPH-G exceeding 100 milligrams per kilogram (mg/kg) and TPH-O, heavy petroleum oils exceeding 200 mg/kg, were removed. These action levels correspond to MTCA Method A cleanup levels for simple sites. Under Washington Administrative Code (WAC) 173-303-700(3), Method A is appropriate for routine cleanup actions or those that involve relatively few hazardous substances. Method A was selected for the north underground storage tank because the contamination consisted of only two fuel indicator parameters present in a single media (soil). In addition, the area was able to be restored to cleanup levels by excavating 75 tons of soil.

Press Room. Soil samples taken beneath the press building were analyzed for polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), and TPH-G, TPH-D, and TPH-O. These chemicals were chosen based on the use of naphthalene-based inks by The Journal American. Analytical results for TPHs were compared with MTCA Method A cleanup levels. Because the TPH-O contamination discovered is located beneath the press

building, a cleanup level has not been established for the area beneath the press room. Soil analytical results are compared with MTCA Method A cleanup levels in Section 7.

South Underground Storage Tank. Soils in the area of the south underground storage tank were analyzed for TPH-G, TPH-D, and TPH-O based on the historical use of petroleum products in the area. Soils with concentrations of TPH-G exceeding 100 mg/kg and TPH-D exceeding 200 mg/kg were removed to the extent practicable. These action levels correspond with MTCA Method A cleanup levels for routine cleanup actions. Because the contamination above MTCA Method A levels extends beneath the press building and loading dock area, complete removal was impractical at this time.

7.1.2 Groundwater

Groundwater was initially analyzed for TPH-G, TPH-D, and BTEX based on the historic presence of the underground petroleum storage tanks and pump island. Following the first sampling event, subsequent monthly sampling events were conducted. Samples were analyzed for TPH-G and BTEX, which were used as screening analytes for detecting groundwater contamination. Groundwater monitoring samples are compared with MTCA Method A in Section 11. MTCA Method A provides a conservative cleanup level for sites undergoing routine cleanup actions or sites with relatively few hazardous substances. Because none of the monitoring well samples exceeded MTCA Method A levels, no cleanup level was established.

7.2 Points of Compliance

North Underground Storage Tank. Points of compliance for the north underground storage tanks were the four walls of the excavation. Confirmation sampling results are compared with MTCA Method A Cleanup levels in Table 4 in Section 10.3.

South Underground Storage Tank. Points of compliance for the south underground storage tank correspond to the existing groundwater monitoring wells (MW1, MW2, MW3, and MW4) shown in Figure 8. Groundwater analytical results are compared with MTCA Method A cleanup levels in Table 10 in Section 11.

7.3 Additional Applicable or Relevant and Appropriate Requirements (ARARs)

Minimum standards for the construction and maintenance of wells (WAC 173-160) are applicable if onsite monitoring wells are replaced or abandoned.

The petroleum hydrocarbon contaminated soils sampled did not designate as a dangerous waste; therefore, dangerous waste regulations (WAC 173-303) are not applicable.

8 Explanations of Remedial Actions Taken and Rationale for Selecting the Remedial Action

The remedial action taken and rationale for selecting the action for each of the three areas of contamination are presented below.

8.1 Remedial Action Taken at North Underground Storage Tank

Approximately 75 tons of petroleum hydrocarbon contaminated soil was removed from the vicinity of the decommissioned underground storage tanks north of the press building on September 23, 1994. The soil was taken to Regional Disposal Company, Roosevelt, Washington, for disposal at a (RCRA Subtitle D) solid waste landfill. Analysis of soil samples taken from the walls and of the excavation pit confirmed that the petroleum hydrocarbon contaminated soil was removed. Analytical results for confirmation soil sampling are shown in Table 4 in Section 10.3.

8.2 Remedial Action Taken at South Underground Storage Tank

Approximately 40 tons of petroleum hydrocarbon contaminated soil was removed from the vicinity of the decommissioned underground storage tank south of the press building on September 23, 1994. The soil was taken to Regional Disposal Company, Roosevelt, Washington, for disposal at a (RCRA Title D) landfill. Petroleum hydrocarbon contaminated soils were removed to the extent possible without disturbing the soil supporting the press building foundations.

8.3 Remedial Action Taken at Press Building

No soil was removed beneath the press building and loading dock. Based on computer modeling of soil analytical results, approximately 550 cubic yards of soils that exceed MTCA Method A Cleanup levels for TPH-D and TPH-G have been left in place. The majority (approximately 93 percent) of the remaining petroleum-contaminated soil lies 7 to 12 feet below the concrete floor of the press room and the press building foundation. The other approximately 7 percent of the remaining petroleum-contaminated soils are 7 to 12 feet below the paved parking area and loading dock to the south of the press building. Contours of the remaining gasoline- and diesel-contaminated soils are shown in Figures 6 and 7. Figures 8 and 9 show the subsurface gasoline- and diesel-contaminated soil, respectively.

Containment was chosen as an appropriate remedial action for the subject soils beneath the press building, its foundation, loading dock, and parking area based on the effectiveness of containment, impracticality of removal, and economic imprudence of removal.

8.3.1 Effectiveness of Containment

The petroleum-contaminated soil beneath the press building is capped by a concrete slab floor with a minimum thickness of 6 inches and a maximum thickness of 12 inches in the

area of the printing presses. Contaminated soils outside of the building footprint are capped by asphalt and a concrete loading dock. To ensure the integrity of the asphalt parking area, the south parking area will be repaved with 4 inches of asphalt after approval of this IRAR.

Under MTCA regulations, containment of hazardous substances may comply with cleanup standards, provided that monitoring is conducted and adequate institutional controls are in place to ensure long-term effectiveness of the cleanup action (WAC 173-340-360(8)). Institutional controls for The Journal American site are presented in Section 9. Groundwater monitoring has been conducted at the compliance points for the press building and the south underground storage tank. Groundwater monitoring results are presented in Table 10.

Contamination beneath the press building and at the south underground storage tank is believed to be caused by fuel dispensing activities that were conducted before construction of the press building. However, the south underground storage tank and the fuel dispensing island were removed before construction of the press building in 1983. Therefore, the press building and paved parking area began serving as a cap to the petroleum-contaminated soils when the building and parking area were constructed in 1983. The effectiveness of this containment is demonstrated by groundwater analytical results taken more than a decade after the press building was constructed. Groundwater samples collected in 1994 and 1995 had no concentrations of gasoline or diesel above MTCA Method A cleanup levels for groundwater. These groundwater monitoring locations and sample results are presented in Section 11.

8.3.2 Impracticality of Removal

The majority of contamination that remains in place (approximately 97 percent, or 430 cubic yards) lies either directly beneath the building or within the soil that provides structural support for the building foundation. (See Figures 8 and 9.) Removal of contaminated soils beneath the press room, loading dock, and adjacent parking area would interrupt printing presses and newspaper production activities. Because there is a relatively small quantity of low-concentration contamination onsite and because it is Ecology's policy to avoid unnecessary disruption of business operations when contamination may exist under buildings or other appurtenances critical to a facility's continued operations, removal of soil beneath the building appears unwarranted.

The estimate of petroleum-contaminated soils that remain beneath the press building is based on the City of Bellevue's interpretation of what is considered "beneath a building." Because removal of soil near a building foundation may compromise building stability, the City of Bellevue uses the 1994 Uniform Building Code (UBC) Section 1806.4 as a standard to define the area beneath a building that is considered to be an integral part of the building. According to the UBC, a building's foundation may be compromised if soil is disturbed beneath a line that extends downward and outward at a 45 degree angle (1:1 slope) from the base of the foundation. Soil included beneath this envelope is considered under the UBC to be "beneath" the building.

CH2M HILL investigated options for removing additional soil outside of the building foundation support in the south underground storage tank area. As a result of this investigation, the following impediments to excavation were identified.

Excavation Configuration Limits the Volume of Soil That Can be Safely Removed.

Although a 1:1 slope is not expected to compromise building stability, an unshored excavation at this angle is potentially unstable and may present a danger to workers entering the excavation. The maximum slope allowed for an unshored excavation under Washington Industrial Safety and Health Administration (WISHA) is 1.5:1 (33-degree slope) (WAC 296-155). In areas where soil cannot stand at a 1.5:1 inclination, a larger safety factor (i.e., flatter slope) is needed. Considering the soil composition at The Journal American site, an excavation slope of 1.75:1 would provide an adequate safety factor. A 1.5:1 excavation slope may technically be accomplished but has a greater risk of slope movement or settlement than does a 1.75:1 slope. The relationship of the various slopes the foundation of the press building is shown in Figure 11. The volume of petroleum-contaminated soil that could be removed without impairing building integrity or worker safety in an unshored excavation is estimated at only 40 cubic yards, or 7 percent of the total contamination estimated onsite.

Disruption of Newspaper Operations. The press room of The Journal American houses the printing presses used for production of this daily newspaper. The presses have extremely tight tolerances for alignment. Measurable settlement of the press room floor would cause damage to the presses and interruption of printing operations. To excavate as much material as possible outside of the press building and its foundations without causing settlement to the press room, the use of drilled and jet-grout shoring was investigated. The geotechnical considerations of the shoring techniques is discussed in a memorandum by Kevan Sharp, CH2M HILL, in Appendix C. The memorandum concludes that although the shoring could adequately protect the building from damaging settlement, both shoring systems posed a risk of interrupting printing operations. The shoring techniques significantly increase the cost of removal, may not prevent interruptions of newspaper operations, and remove only an additional 2 percent of the total of contaminated soils left in place. Effectiveness and cost comparisons of the different shoring techniques are presented in Table 1.

An excavation outside of the press room would disrupt newspaper and printing press operations. Excavation of contamination outside of the press room would necessitate removal of the loading dock, which serves as the only access for delivery of newsprint paper. The maximum paper supply that can be stored onsite is a 28-day supply. It is uncertain whether an excavation operation could be conducted so that the loading dock would be removed, excavation completed, and the dock reinstalled to a serviceable state within 28 days. In addition, rooms along the south wall of the building would have to be vacated during excavation, causing temporary relocation of the ink and chemical storage areas, utility room, and compressor room.

8.3.3 Economic Imprudence

Under MTCA, the cost of a cleanup alternative is impractical “if the incremental cost of the cleanup action is substantial and disproportionate to the incremental degree of protection it would achieve over a lower preference cleanup action.” (WAC 173-340-360(5)(iv)) Costs and percentages of contamination that could be removed outside the press room using different shoring options are presented in Table 1. The volumes of contaminated soils located “outside” and “beneath” the building are based on computer modeling of soil sampling results.

The table includes cost estimates for removal of the contaminated soil currently beneath the building. Cost estimates are given for removal of soil beneath and outside the building as if the press building were not in place (bare land scenarios). In addition, removal of contaminated soil outside the press building was calculated as if the press building were removed. Although this option was calculated as if The Journal American site were bare land, shoring costs would still be incurred because shoring would be used to protect an adjacent offsite building.

Based on the structural and operational constraints, the quantity of contaminated soil that could be excavated outside of the soils “beneath” the press building is less than 10 percent of the total volume of contaminated soil. By using jet-grout shoring, an additional 10 percent of the contaminated soil can be removed, but at an additional incremental cost of \$200,000. The high cost of excavating a minimal amount of the total contamination onsite renders this option economically imprudent. The incremental cost of excavating contamination outside of the building while the building is in place increases the cost of the work from \$220,000 to \$420,000 as compared with the cost of excavation at such time as the building were removed. This cost increase is substantial and disproportionate to the minimal incremental degree of environmental protection provided.

Data does not suggest that adverse environmental impacts have resulted from the presence of the petroleum-contaminated soil onsite. Further removal of petroleum-contaminated soil appears to be unwarranted based on the costs, projected interference with business operations caused by removal activities, and minimal increase in environmental protection provided by additional soil removal.

**Table 1
Comparative Cost and Volume for Soil Removal Options
The Journal American**

Removal Option	Volume of Soil to be Removed (in cubic yards)		Shoring Cost	Cost for Removal Outside Building	Percentage of Total ¹ Contaminated Soil Removed	Cost Per Cubic Yard of Contaminated Soil Removed Outside of Building
	All Soil	Contaminated Soil				
Excavation of Soil Beneath and Outside Building After Building is Removed	3,225	555	\$25,000	\$239,000	100%	\$430
Excavation of Soil Beneath ² Building After Building is Removed	2,325	430	\$0	\$179,000	78%	\$416
Excavation Options for Removal of Soil "Outside" of Press Building						
Open-Cut Excavation	830	40	\$0	\$220,000	7%	\$5,500
4-Foot-High Drilled Shoring	875	70	\$60,000	\$280,000	12%	\$4,000
Full-Height Jet Shoring	975	125	\$200,000	\$420,000	22%	\$3,360
Excavation of Soil Outside of Building after Building is Removed	975	125	\$25,000	\$60,000	22%	\$480

¹Total of contamination currently located outside and beneath the press building.

²Beneath building is calculated here as if a vertical line were drawn down from the building foundation.

9 Institutional Controls

Except for natural degradation processes, the concentrations and location of petroleum contaminants would remain as presented in Section 8. The following institutional controls to prevent disturbance of the petroleum-contaminated soils are planned or are in place at the facility:

- Northwest Media (Washington), L.P. will record a restrictive covenant on The Journal American property with the register of deeds for King County. The restrictive covenant will run with the land and be binding on the owner's successors and assigns unless and until it is removed according to its terms. The covenant will include a survey plan prepared by a professional land surveyor and will indicate the location and dimensions of petroleum hydrocarbons remaining at the site above MTCA action levels. The covenant will restrict activities at the site that may result in the release of such petroleum hydrocarbons as specified in WAC 173-340-440 (5)(b). The covenant will be forwarded to Ecology upon completion.

- Following approval by Northeast Media (Washington), L.P., Persis will submit a survey plat to Ecology. The plat will be prepared and certified by a professional land surveyor and will include the location and dimensions of petroleum hydrocarbon contamination remaining at the site. The plat will contain a prominently displayed note stating the owner's obligation to prohibit activities that will interfere with the containment protection at the site as specified in WAC 173-340-440 (5)(b). Restriction to ensure that institutional controls remain in place as long as needed will include the following:

 1. A description of the contaminant type, location, and extent
 2. A notice requiring written notification to Ecology before excavating, moving, or removing soils or material above MTCA action levels for petroleum hydrocarbons beneath the floor, loading dock, and asphalt paving
 3. A statement requiring written notification to Ecology before removal or destruction of the existing building, loading dock, or asphalt paving

- Residential use of The Journal American site is restricted through zoning and land use planning. The Journal American site is currently zoned for light-industrial use and is used for light-industrial purposes. Properties adjacent to and in the general vicinity of the site are also designated for light-industrial use. The Journal American site is expected to be used for light-industrial purposes into the foreseeable future. Light industrial use is in conformance with the comprehensive land use plan designation for the area (LI-Belred, Northup).

10 Sampling and Analysis

This section presents the sampling approach and procedures used at the north underground storage tanks, press room, and south underground storage tank.

10.1 Field Screening Techniques

All soil samples (hand augering, test pits, and shallow borings) were field screened for VOCs using an organic vapor monitor (OVM). OVM readings and visual or olfactory indications of contamination of borings were documented in the field log with other field sampling data.

10.2 Sampling Procedures

Soil samples were collected using hand augering below floors, near-surface sampling, test pits, and soil borings at greater depths. Sampling locations for each area are shown in Figures 4 and 5. A reference table for sample locations is provided in Table 11. A private utility locator was subcontracted to locate subsurface utilities prior to sampling.

Near-Surface Samples. Near-surface soil samples were collected from beneath the press room floor in the upper 6 inches with a stainless steel trowel or spoon. The sample area was prepared by shoveling or scraping away any gravel, fill, or other debris prior to sample collection. Soils were screened for VOCs with a calibrated OVM during sampling.

Soils and other material encountered during sampling were logged on a soil boring log field form. Soils were logged and classified in accordance with ASTM D 2488, Standard Practice for Description and Identification of Soil (Visual-Manual Procedures). Soil boring logs are included in Appendix A.

The sampling equipment was decontaminated before and after each sample was collected using the decontamination method described below.

Hand-Augered Samples. Hand-augered soil samples were collected from beneath the press room floor with a bucket-type hand-auger to a depth of up to 5 feet. At locations where samples were collected beneath the concrete, a concrete corer was used to cut the concrete to provide sampling access. At locations where samples were collected beneath wood flooring, holes were cut in the flooring with a saw to provide sampling access. Samples were obtained by collecting soil directly from the hand-auger buckets at the specified sample intervals. Soils were screened for VOCs with a calibrated OVM during sampling.

Soils and other material encountered during sampling were logged on a soil boring log field form. Soils were logged and classified in accordance with ASTM D 2488, Standard Practice for Description and Identification of Soil (Visual-Manual Procedures). Soil boring logs are included in Appendix A. See Section 4.2 for a summary of soil types. Any concrete that was removed was replaced with an appropriate patch material and grouted.

The auger bucket was decontaminated before and after each sample using the decontamination method described below. The extensions and handle of the hand auger were decontaminated between hand-auger locations.

Soil Boring Samples. A hollow-stem drilling rig was used to advance borings to a specified depth depending on the area of investigation (generally approximately 10 feet). Soil boring samples were collected at the bottom with split-spoon samplers. The samplers were inserted through the center of the hollow-stem augers and mechanically driven through the required sampling interval. Samples were obtained by collecting soil directly from the split spoon sampler. Soils taken from the borings in the north underground storage tank area and the single boring in the area of the former fuel dispensing island were screened for VOCs with a calibrated OVM during sampling. If organics were detected, the boring was extended at 2.5-foot increments and additional samples were collected until OVM readings showed no organics present.

Soils and other material encountered during sampling were logged on a soil boring log field form. Soils were logged and classified in accordance with ASTM D 2488, Standard Practice for Description and Identification of Soil (Visual-Manual Procedures). Soil boring logs are included in Appendix A.

The borings were abandoned in accordance with State of Washington abandonment requirements (WAC 173-160) after drilling was completed. The parking lot surface was patched at the completion of the field work. Soil cuttings were placed in drums, characterized in accordance with Ecology's Dangerous Waste Requirements (WAC 173-303), and properly managed.

The split-spoon sampler used to collect the samples was decontaminated before and after each sample using the decontamination method described below. The augers, rods, tools, and other items were decontaminated by steam cleaning before and after each boring was drilled.

Initial soil boring samples collected in September 1994 from boring in the north underground storage tank area and the single boring in the area of the former fuel dispensing island were analyzed for VOCs using U.S. Environmental Protection Agency (EPA) Method 8240 and for hydrocarbon identification using the hydrocarbon identification (HCID) screen. Depending on the results of the HCID screen, the appropriate corresponding TPH analysis was performed (Washington State Methods WTPH-6, WTPH-D, and WTPH-418.1). Subsequent soil borings were analyzed only for WTPH-6 and WTPH-D to determine the content of the contamination underneath the press building.

Test Pits. A test pit was dug in the area of the decommissioned south underground storage tank formerly located on the south side of the press building. A test pit, rather than a soil boring, was dug because of the lack of documentation confirming the decommissioning and actual location of the tank. A backhoe was used to break through the asphalt parking lot approximately 10 feet south of the press building south wall. The test pit was advanced to a depth of 7 to 10 feet and a width of 5 to 7 feet. Soils were observed and field screened for VOCs using an OVM. Material removed from the excavation was stockpiled on a Visqueen

liner on the asphalt parking lot. Soil samples were collected from the stockpiled material to determine appropriate material handling and disposal procedures. At the completion of the test pit, a Visqueen liner was placed in the bottom of the pit to mark the depth, and the stockpiled material was placed back into the pit. No groundwater or saturated soil was encountered in the test pit to a depth of approximately 10 feet.

Soil samples were analyzed for hydrocarbon identification using the HCID screen. Depending on the results of the HCID screen, the appropriate corresponding TPH analysis was performed (Washington State Methods WTPH-G, WTPH-D, and WTPH-418.1).

Decontamination Procedures. A temporary decontamination station was constructed onsite to collect and store decontamination fluids. All decontamination fluids and solids were collected and placed in U.S. Department of Transportation (DOT) 55-gallon drums.

All downhole drilling and sampling equipment and the backhoe bucket were decontaminated before and after sampling at each location using a high-pressure steam cleaner. Other sampling equipment, such as split spoon samplers, spoon samplers, bowls, and hand-auger buckets, were decontaminated after the collection of each sample according to the following procedure:

- Wash with a tap water and Liquinox or Alconox detergent solution
- Rinse with tap water
- Rinse with a 10 percent methanol and distilled water solution
- Rinse with distilled water
- Air dry as long as possible
- Place in a clean plastic bag or wrap in aluminum foil (shiny side out)

Sample Handling, Storage, and Delivery. Filled sample containers were labeled with the project name, sample number, analysis to be performed, date and time of collection, and the sample processor's initials. Samples were placed on ice in an ice chest and packed with foam, bubble wrap, or vermiculite to prevent container breakage. A chain-of-custody form was completed and placed in a sealed bag and taped to the inside lid of the ice chest. Chain of custody forms are provided in Appendix F. The chest was then sealed shut with fiber-reinforced tape and hand-delivered to the laboratory within 24 hours of sample collection. To retain sample integrity, the samples remained in sight of field personnel or in a locked location at all times until they were hand-delivered to the laboratory.

Sample container, preservation method, and holding time requirements are listed in Table 2. The holding time started at the time of sample collection in the field. Quality control (QC) procedures were established to ensure that samples collected at the site were consistent with project objectives.

Table 2 Container, Preservation Method, and Holding Time Requirements for Samples The Journal American			
Parameter	Container	Preservative	Holding Time
Soil			
OVM (field screen)			
Hydrocarbon Identification (HCID screen)	One 4-oz glass	Cool 4°C	14 days
Total Petroleum Hydrocarbons (WTPH-G, WTPH-D, WTPH-418.1)	One 4-oz glass	Cool 4°C	14 days
Volatile Organic Compounds (Method 8240)	One 4-oz glass	Cool 4°C	14 days
Polynuclear Aromatic Hydrocarbons (Method 8270)	One 4-oz glass	Cool 4°C	14 days

Field Quality Control Samples. Field QC procedures include the collection of equipment rinse blank and completion of all appropriate sample documentation. One equipment rinse blank was collected and analyzed for VOCs. Equipment rinse blanks were collected by pouring ASTM Type II reagent grade water, or equivalent organic-free water, into a decontaminated sampling device and then into appropriate sampling containers.

10.3 Laboratory Analysis Reports

10.3.1 North Underground Storage Tank

Petroleum hydrocarbon-related contaminants were detected in soil in the vicinity of the former north underground storage tank area at concentrations greater than the MTCA Method A cleanup levels for gasoline (100 ppm) and heavy petroleum oil (200 ppm). Initial sample analysis detected concentrations of gasoline at 280 ppm and heavy petroleum concentrations at 320 and 890 ppm. Approximately 75 tons of petroleum hydrocarbon contaminated soil were removed from the north underground storage tank area. Table 3 shows the results of the initial soil sampling in the area of the north underground storage tanks and Table 4 shows the confirmation sampling results taken from the side walls and bottom of the soil excavation pit. Appendix B contains copies of laboratory analytical data provided by Sound Analytical Services, Tacoma, Washington. No groundwater or saturated soil was encountered during the soil excavation activities.

10.3.2 Press Room

Table 5 presents data results from the initial investigation of the press room for naphtha-based ink residues in soil beneath the press room floor. Petroleum-related products (diesel and heavy petroleum oil) were detected in three sampling locations in the press room. The detected concentrations of 77 ppm and 160 ppm, respectively, are below the MTCA Method A cleanup level for simple sites. The third analytical result is at the MTCA Method A cleanup level of 200 ppm for heavy petroleum oil. Several additional samples in the press room area had detected the VOCs acetone, methyl chloride, and chloroform. Because acetone and methyl chloride were also detected in laboratory equipment blanks, these sample results are considered to be the result of laboratory contamination. The detected concentration of chloroform was estimated by the laboratory because the value was below the calibrated equipment detection level. The detected concentration of chloroform was below the MTCA action level. Several low levels of non-carcinogenic PAHs were also detected in samples from the press room. There are no established MTCA Method A cleanup action levels for non-carcinogenic PAHs.

10.3.3 South Underground Storage Tank

Initial soil sample analysis indicated that concentrations of petroleum hydrocarbon products in the vicinity of the south underground storage tank exceeded the current MTCA Method A cleanup levels. Figure 4 indicates the approximate initial sample locations and Table 9 lists the corresponding detected concentrations. Approximately 60 additional soil borings were completed in the press room building and outside the press building (in the south parking lot) to determine the nature and extent of the contamination. Appendix A contains the soil boring logs from these sampling locations. Table 9 summarizes the soil sampling analytical results and laboratory data reports are provided in Appendix B. The detected contamination in the vicinity of the south underground storage tank and pump dispensing island is believed to have been in place before construction of the press building in 1983. The majority of the soil contamination associated with this underground storage tank is located under the footprint and subsurface structural support of the building.

10.4 Sampling Locations

Initially, 12 borings and one test pit were completed at the site to investigate soils in the area of two former underground storage tank farms (north and south of the press building). In addition, four shallow soil borings were completed around the printing press. A summary of the sample locations and number of samples collected is provided in Table 7. Figure 4 identifies the initial soil boring and test pit locations.

Sample results from the initial borings and test pit detected petroleum-related contamination in soils in the vicinity of the south underground storage tank and fuel dispensing island. Approximately 60 subsequent soil borings were completed in the press building and the area south of the press building to further delineate the horizontal and vertical depth of the TPH contamination. Figure 5 identifies these subsequent soil boring locations. A detailed description of the areas of investigation and sample locations is provided in the following subsections.

<p align="center">Table 7 Initial Soil Sampling Summary The Journal American</p>

<p>Type of Sample Collection</p>	Boring	Hand auger	Test pit

10.4.1 North Underground Storage Tank

Two 5,000-gallon underground storage tanks were removed from the area north of the press building in 1989 by the Longview Publishing Company. Review of historical information indicated that the tank bottom was approximately 10 feet bgs. Six borings (JA-BH-01 through JA-BH-06) were drilled in locations selected to delineate the lateral extent of backfill that was put in place when the tank was removed to determine the previous location of the tank. Samples were collected from depths believed to correspond with the previous bottom of the tanks to confirm that no residual contamination existed. Figure 4 identifies the boring locations.

Soil samples were collected between approximately 6 to 15 feet bgs depending upon field screening techniques and the detection of organic vapors with the OVM. All soil samples from the subsurface investigation of this former underground storage tank location were analyzed for TPH-G, TPH-D, VOCs, and total lead. Analytical results of the soil samples are presented in Table 9 and laboratory reports are included in Appendix B.

10.4.2 Press Room

Following a visual inspection of the area immediately surrounding the printing press and discussions with personnel familiar with the press operations, four sample points were selected (JA-PR-01 through JA-PR-04) in the vicinity of the press room. One boring (JA-PR-01) was located adjacent to the press to the east and three borings (JA-PR-02 through JA-PR-04) adjacent to the west. The borings were located as close as possible to the printing press.

A number of factors were considered when selecting the sample locations in the press room, such as excessive staining of inks, pools of lube oil, and cracks in the floor. The concrete slab along the west side of the press was heavily stained with oil. The source appeared to be a series of 5-gallon lube oil reservoir tanks along the west side of the press. Cracks and seams in the concrete slab were targeted as sample points because these are likely routes of migration for contaminants. Additionally, buried electrical lines running parallel to the press on both the east and west sides prevented locating sample points any closer than approximately 20 inches from the edge of the equipment.

Four subsurface (i.e., below slab) soil samples were collected and analyzed for hydrocarbons by Washington total petroleum hydrocarbon identification (WTPH-HCID) and appropriate WTPH follow-up. Samples were also analyzed for PAHs (EPA 8270-SIM), VOCs (EPA 8240), and semivolatiles (EPA 8270).

10.4.3 South Underground Storage Tank

Historical site drawings provided information about the location of an underground storage tank and fuel dispensing island on the south end of the press room. The tank was located along the southern exterior building wall directly east of the service entrance to the press building. Site maps indicated that the fuel dispensing island was located approximately 20 feet inside the press room south wall, inside what is now the shop area. Subsurface soils were sampled in the vicinity of the former tank and fuel dispensing island to assess the possible presence of contamination.

Initially, one boring (JA-PRT) was located inside press room where the former fuel dispensing island was identified. A test pit was excavated in the approximate location of the former underground storage tank just outside the south wall of the press building (see Figure 4).

Two samples (JA-PRT-01 and JA-PRT-02) were collected and analyzed from the borehole located near the former pump island. Soil samples were collected at 9 feet bgs and 15 feet bgs, respectively. In addition, one non-water quality reconnaissance water sample was taken from the open borehole.

During locating activities, an underground utility locating service observed signals from the metal detector that suggested that the tank(s) may have still been buried outside the south wall of the press building. Conclusive evidence of the tank's presence was not available, so a contractor was called to the site to excavate an exploratory test pit to assess the presence of underground storage tank(s). The test pit was located just south of the press building wall and east of the loading dock (see Figure 4). Two samples (JA-UST-01 and JA-UST-02) were obtained from the bottom of the test pit approximately 7 feet bgs and from the material stockpile, respectively.

Samples from the initial investigation of the south underground storage tank indicated gasoline and diesel at concentrations greater than the MTCA Method A cleanup levels of 100 mg/kg and 200 mg/kg, respectively. In order to assess the horizontal and vertical extent of

the contamination in the area of the south underground storage tank, approximately 60 addition borings were completed. Figure 5 identifies the locations of the subsequent borings.

10.5 Sampling Approach

10.5.1 North Underground Storage Tank

Historical data provided evidence that two 5,000-gallon petroleum underground storage tanks were previously located at the site, in the area of the north parking lot to the north of the press building. These north underground storage tanks were removed in 1989. Documentation of proper decommissioning was not available. Boring locations were designed to delineate the previous location of the tanks and assess whether TPH-contaminated soil had been left in place. Borings JA-BH-01 through JA-BH-04 were completed in a line from east to west. The same approach was used for borings JA-BH-05 and JA-BH-06 slightly to the southwest of JA-BH-01 through JA-BH-04.

At each sample location a hollow-stem auger was advanced to the transition point between imported fill and native soil. A stainless steel split-spoon sampler was then driven through the sample point for soil collection. Soils were screened for VOCs with a calibrated OVM during sampling, and results of the screening were recorded. Soils and other material were logged on a soil boring log field form in accordance with ASTM D 2488, Standard Practice for Description and Identification of Soil (Visual-Manual Procedure). Appendix A contains soil boring logs.

JA-BH-01 did not appear to be within the limits of the former underground storage tank because drilling was difficult and consistent with drilling through native soils. Cuttings consisted of a very fine, gray, silty sand. No staining or other signs of contamination were observed. OVM readings on the cuttings were all 0.0 ppm. The auger was advanced to 15 feet bgs where the sample was collected.

Samples JA-BH-2 and JA-BH-03 were both driven at 18 inches to 10 feet bgs. Drilling was consistent with drilling through backfill. The cutting consisted of a ton sand and gravel mix similar to pit run material commonly used for backfill in this area. No staining or other signs of contamination were observed. OVM readings of the cuttings from these two borings did not exceed 0.2 ppm.

The transition from fill to native soil at JA-BH-04 and JA-BH-05 appeared to occur at 6 feet bgs. The cuttings generated at these locations were identical to cuttings from JA-BH-02 and JA-BH-03. No stains or other signs of contamination were observed. OVM readings did not exceed 0.2 ppm. The samples were driven at 6 feet bgs.

While boring JA-BH-06, the odor of gasoline became apparent as the auger advanced through the 2 to 4 feet bgs interval. No staining of soil cuttings was observed; however, OVM readings of this material ranged from 15 to 35 ppm. The auger was advanced to 6 feet bgs where sample JA-BH-06 was collected. A sample of the cuttings (which were drummed) was also collected.

The borings were abandoned in accordance with State of Washington abandonment requirements (WAC 173-160). The parking lot surface in the areas of the north underground storage tanks was patched at the completion of the field work. Soil cuttings were placed in 55-gallon drums.

All soil samples from the subsurface investigation of this former underground storage tank area were analyzed for TPHs, VOC, and total lead. A summary of these analyses are included in Table 9 and laboratory analytical reports are included in Appendix B.

The split-spoon sampler used to collect the samples was decontaminated before and after each sample using the decontamination method described in Section 10.3. The augers, rods, tools, and other items will be decontaminated by steam cleaning before and after each boring was drilled.

10.5.2 Press Room

The flooring in the press room was stained extensively with black ink and lube oil. Pools of ink and lube oil were common below the press blankets. The black ink, according to the Material Safety Data Sheet (MSDS), contains naphtha compounds, and the lube oil was petroleum-based.

A concrete coring company was subcontracted to core 6-inch-diameter holes in the concrete slab at the sample points described in Section 10.4 and shown in Figure 4. A shop vacuum was used to continuously control water from the drill. The coring was a wet procedure, so no generation of dust was evident.

Subsurface soil samples were then collected using a stainless steel hand auger. At each location (JA-PR-01 through JA-PR-04) a surface sample was collected from the top of the exposed soil and was field screened with an OVM. Subsequent sample collection at depths below surface was based on visual inspection of the surface sample, results of the OVM field screen, and the ability of the samples to advance the auger through the soils and cobbles. Table 7 summarizes these activities. All field work was performed in accordance with the Health and Safety Plan (CH2M HILL, August 1994) prepared specifically for the type of work performed.

The soil was a moist, light brown sandy material with cobbles ranging from one-half inch to more than 4 inches. Upon completion of sample collection, the concrete bore locations were patched with ready mix concrete.

Samples were sent to Sound Analytical Services in Tacoma, Washington, to be analyzed for hydrocarbons WTPH-HCID and appropriate WTPH follow-up. Samples were also analyzed for VOCs (EPA 8240) and semivolatile organic compounds (SVOCs) (EPA 8270). Samples collected from the press room were also tested for PAHs using EPA Method 8270. This method is sensitive to naphtha-based compounds. The sample analysis results for JA-PR-01 through JA-PR-04 are provided in Appendix B.

10.5.3 South Underground Storage Tank

The south underground storage tank was located immediately outside of the south wall of the press room. The fuel dispensing island was located just inside the press room approximately 20 feet from the south wall. This tank was also decommissioned in 1989.

During utility locating activities, the utility locating representative observed a signal from the metal detector that suggested that a tank may still be buried at the site. Conclusive evidence of the tank excavation was not available. A contractor was mobilized to the site to excavate an exploratory test pit to assess the presence of a tank buried at the site. Subsequently, a geophysical survey of the former tank area was conducted by Golder Associates to try to confirm the presence or absence of a tank. The results of the geophysical survey were inconclusive and no definitive determination could be made. The contractor's report is provided in Appendix D.

The contractor used a backhoe with a 24-inch bucket to slowly excavate the area of the former underground storage tank. At 1 foot bgs, a diesel odor was noticed. OVM readings of excavated soils ranged from zero to 10 ppm. As the excavation continued downward, the diesel odor became less noticeable.

Two PVC lines were encountered during the digging: a black 4-inch line running east-west and a white 6-inch line also running east-west. The black 4-inch line appeared to be a dead line and was abandoned. The short 6-inch line was the stormwater line from the catch basin at the bottom of the loading dock and was repaired before backfilling. The excavation was backfilled with the same material that was removed from the hole. No clean fill was imported. Before filling the excavation, it was lined with Visqueen to mark the limits of the pit in case further excavation was required.

The final dimensions of the excavation were approximately 6 feet wide by 20 feet long by 7 feet deep. No tanks were encountered; however, a piece of metal pipe that may have been a fill tube at one time was uncovered and removed from the excavation. Samples were collected at the bottom of the excavation (JA-UST-01 and JA-UST-02) and from the material stockpiled. Samples were analyzed for WTPH-G and WTPH-D. Results of this analysis are found in Table 6.

Subsurface soil samples (JA-PRT-01 and JA-PRT-02) from the former pump island location were collected using a small trailer-mounted drill rig. A 12-inch-diameter hole was cored in the concrete floor at the location of the former pump island as indicated in the old site drawings. A hollow-stem auger was advanced through the concrete floor and into the soil to a maximum depth of 15 feet bgs.

Sample JA-PRT-01-01 was collected at the 9 feet bgs interval. The soil was a dense, compact, gray silty sand. A strong diesel odor was noticed while transferring the soil from the split-spoon sampler to the sample jars. OVM readings were as high as 60 ppm. Sample JA-PRT-02-02 was collected at 15 feet bgs. The soil was a dense clay, gray and brown in

color. OVM readings on this sample were 1.5 ppm. The smell of diesel was still noticeable. Both samples were saturated with water.

All samples were analyzed for WTPH-G and WTPH-D. Results are presented in Table 6. Sample JA-PRT-01-01 detected diesel at 4,500 ppm, and gasoline at least 790 ppm (the concentration exceeded the instrument calibration range). Because analytical results of initial soil sampling in both the north and south underground storage tank areas detected lead at levels well below the 250 ppm MTCA Method A cleanup level for lead, no additional screening for lead was conducted in subsequent sampling events.

Results obtained from investigating the former pump island necessitated an additional 60 borings to determine the horizontal and vertical extent of the detected TPH contamination. A grid was designed to assess the extent of contamination. Figure 5 provides the locations of the additional borings.

All additional borings inside the building were completed with the trailer-mounted drill. The borings outside the building were completed following the same procedures outlined in the north underground storage tank locations.

Samples were collected at depths where organic vapors were detected with the OVM. Two samples were collected from each boring location and tested for VOCs and for hydrocarbons using the HCID screen and corresponding TPH test.

OVM field data were used to determine the possible presence of contamination. If the OVM reading indicated organics in soils at the base of the boring, the boring was extended by 2.5-foot increments to a maximum depth of 20 feet. At each increment, OVM readings were checked and samples collected as required.

Table 8 presents the methodologies for field activities to complete soil sampling and analysis in September 1994. Section 10.3 discusses the sampling results for each of the three areas of site investigation at The Journal American.

Table 8 Analysis Summary The Journal American		
Analyses	Areas	
	Press Room Floor	Tank Area
Field parameter	OVM	OVM
Laboratory parameters (Method)	HCID $\frac{3}{4}$ > TPH* VOC (8240) PAH (8270)	HCID $\frac{3}{4}$ > TPH* VOC (8240)
*The appropriate TPH method was selected based on the results of the HCID screen test. TPH tests were chosen from these methods: WTPH-D, WTPH-G, WTPH-418.1		

10.6 Soil Profile

Site soils are described in Section 4.2. Boring logs for subsurface investigations conducted at the site are included in Appendix A.

10.7 Surface Depth to Groundwater

The depth to groundwater for the September 29 and 30, October 4 through 10, 1994, and May 4 and 5 data is shown on soil boring logs provided in Appendix A. Groundwater wells were installed on September 7 and 13, 1995. Groundwater logs are provided in Appendix E.

Based on soil boring data, it appears that a water-bearing zone occurs in the vicinity of the press room between 9 and 12 feet beneath the ground surface. A large portion of the soil borings did not encounter groundwater to an average maximum depth of 16.5 feet bgs. During installation of groundwater wells, groundwater was encountered between 13 and 18 feet bgs. Based on groundwater elevations measured after well installation, groundwater flow is to the south, with a slight southwesterly direction. Figure 10 shows groundwater levels (contours) and groundwater flow direction.

10.8 Contamination Left in Place

No petroleum-contaminated soil above MTCA Method A cleanup levels remains in the area of the north underground storage tank. Approximately 550 cubic yards of soil exceeding MTCA Method A cleanup levels for TPH-D and TPH-G remain beneath the press building, loading dock, and the asphalt paving. Contours of gasoline- and diesel-contaminated soils are presented in Figures 6 and 7, respectively. Of the 550 cubic yards of petroleum-contaminated soils that remain in place, approximately 93 percent are beneath the press

building floor and in soil supporting the foundation of the press building (See Figures 8 and 9). The loading dock and south parking area cover the other 7 percent of remaining contamination.

11 Groundwater Investigation

11.1 Summary of Most Recent Groundwater Sampling Data

February 1995 groundwater sampling results indicated no petroleum-related parameters in excess of the MTCA Method A cleanup levels from groundwater. A non-water quality reconnaissance sample was taken from the open borehole for the purpose of determining possible impacts to groundwater from soil contamination. The sample was analyzed for WTPH-HCID, VOCs, BTEX, and WTPH-G. Concentrations of greater than 9 ppm gasoline and 23 ppm diesel were detected. Extraction of the sample detected gasoline at 2.8 milligrams per liter (mg/L), benzene at 0.002 mg/L, toluene at 0.001 mg/L, ethyl benzene at 0.006 mg/L, and xylenes at 0.043 mg/L. However, monitoring well sampling from September 1994 through February 1995 detected no petroleum-related contaminant constituents in site groundwater in concentrations that approach or exceed MTCA Method A cleanup levels. Groundwater monitoring well sampling results from monthly sampling events from September 1994 through February 1995 are presented in Table 10. Laboratory analytical results are provided in Appendix B. These subsequent monitoring well sample results are accurate indicators of groundwater quality and comply with the established project-specific QA/QC criteria.

11.2 Location of Monitoring Wells and Maximum Concentration Detected

11.2.1 South Underground Storage Tank

The locations for wells MW-1 through MW-4 are shown in Figure 10. The monitoring wells were installed using a Mobile B-61 hollow-stem auger drill rig. Drilling started on September 7, 1994, and installation of the four wells was completed on September 14, 1994. Tacoma Pump and Drilling of Graham, Washington, performed the drilling and well installation. Drilling, well installation, and development were observed and documented by an onsite CH2M HILL hydrogeologist.

Each of the four boreholes was advanced from ground surface to a depth of approximately 15 to 20 feet. The MW-4 boring was advanced to 60 feet to collect geotechnical information. Split- spoon samples were collected at 5-foot intervals. Monitoring well construction logs are included in Appendix E.

Monitoring wells were constructed in accordance with the State of Washington Minimum Standards for Construction and Maintenance of Wells (WAC 173-160). Each of the wells was constructed of 2-inch-diameter, Schedule 40 flush-threaded PVC casing attached to a 10- or 15-foot section of 0.02-inch machine-slotted Schedule 40 screen. A 6-inch sump was

placed on the bottom of each screen to collect sediment. Each well assembly was situated in the borehole with the top of the screen above the encountered water table depth. Colorado Silica sand, 10-20 grade, was used to fill the annular space of the borehole to a depth of approximately 1.0 feet above the top of the screen. A 2-foot bentonite seal was placed on top of the sand, and bentonite chips were used to fill the annular space to 2 feet bgs. The well construction logs are included in Appendix E.

Four flush-mount surface completions were cemented in place to secure the monitoring wells. Each PVC well casing was surveyed to the nearest 0.01 foot based on a temporary datum (edge of building was assumed to be 100 feet above sea level). The reference point at each well for groundwater level measurements was designated by a black mark at the top of the PVC casing.

The monitoring wells were developed on September 8 and 14, 1994, by surging and bailing. MW-1 was developed for 30 minutes with a net volume of 5 gallons extracted. MW-2 was developed for 30 minutes with a net volume of 15 gallons removed. MW-3 was developed for 20 minutes with a net volume of 25 gallons. MW-4 was developed for 25 minutes with a net volume of 30 gallons. The water was slightly turbid following well development.

12 Regulatory Records and Permits

12.1 Environmental Permits Currently or Previously Held

No regulatory permits related to the independent remedial action exist. Because this IRAR focuses on petroleum hydrocarbon contaminated soils unrelated to the operations of The Journal American, regulatory records and permits related to the day-to-day operation of The Journal American (e.g., dangerous waste generation) are not included here.

12.2 Regulatory Activities Applicable to the Site

There are no known federal or state environmental regulatory activities at The Journal American site related to the petroleum hydrocarbon contamination.

13 Hazardous Substance Management and Handling Practices

13.1 Decontamination Procedures

A temporary decontamination station was constructed onsite to collect and store decontamination fluids. All decontamination fluids and solids were collected and placed in 55-gallon drums for disposal.

Sampling equipment, including hand-auger buckets, spoons, and bowls, was decontaminated following the collection of each sample according to the following procedure:

- Wash with a tap water and Liquinox or Alconox detergent solution
- Rinse with tap water
- Rinse with a 10 percent methanol and distilled water solution
- Rinse with distilled water
- Air dry as long as possible
- Place in a clean plastic bag or wrap in aluminum foil (shiny side out)

13.2 Sample Handling, Storage, and Delivery

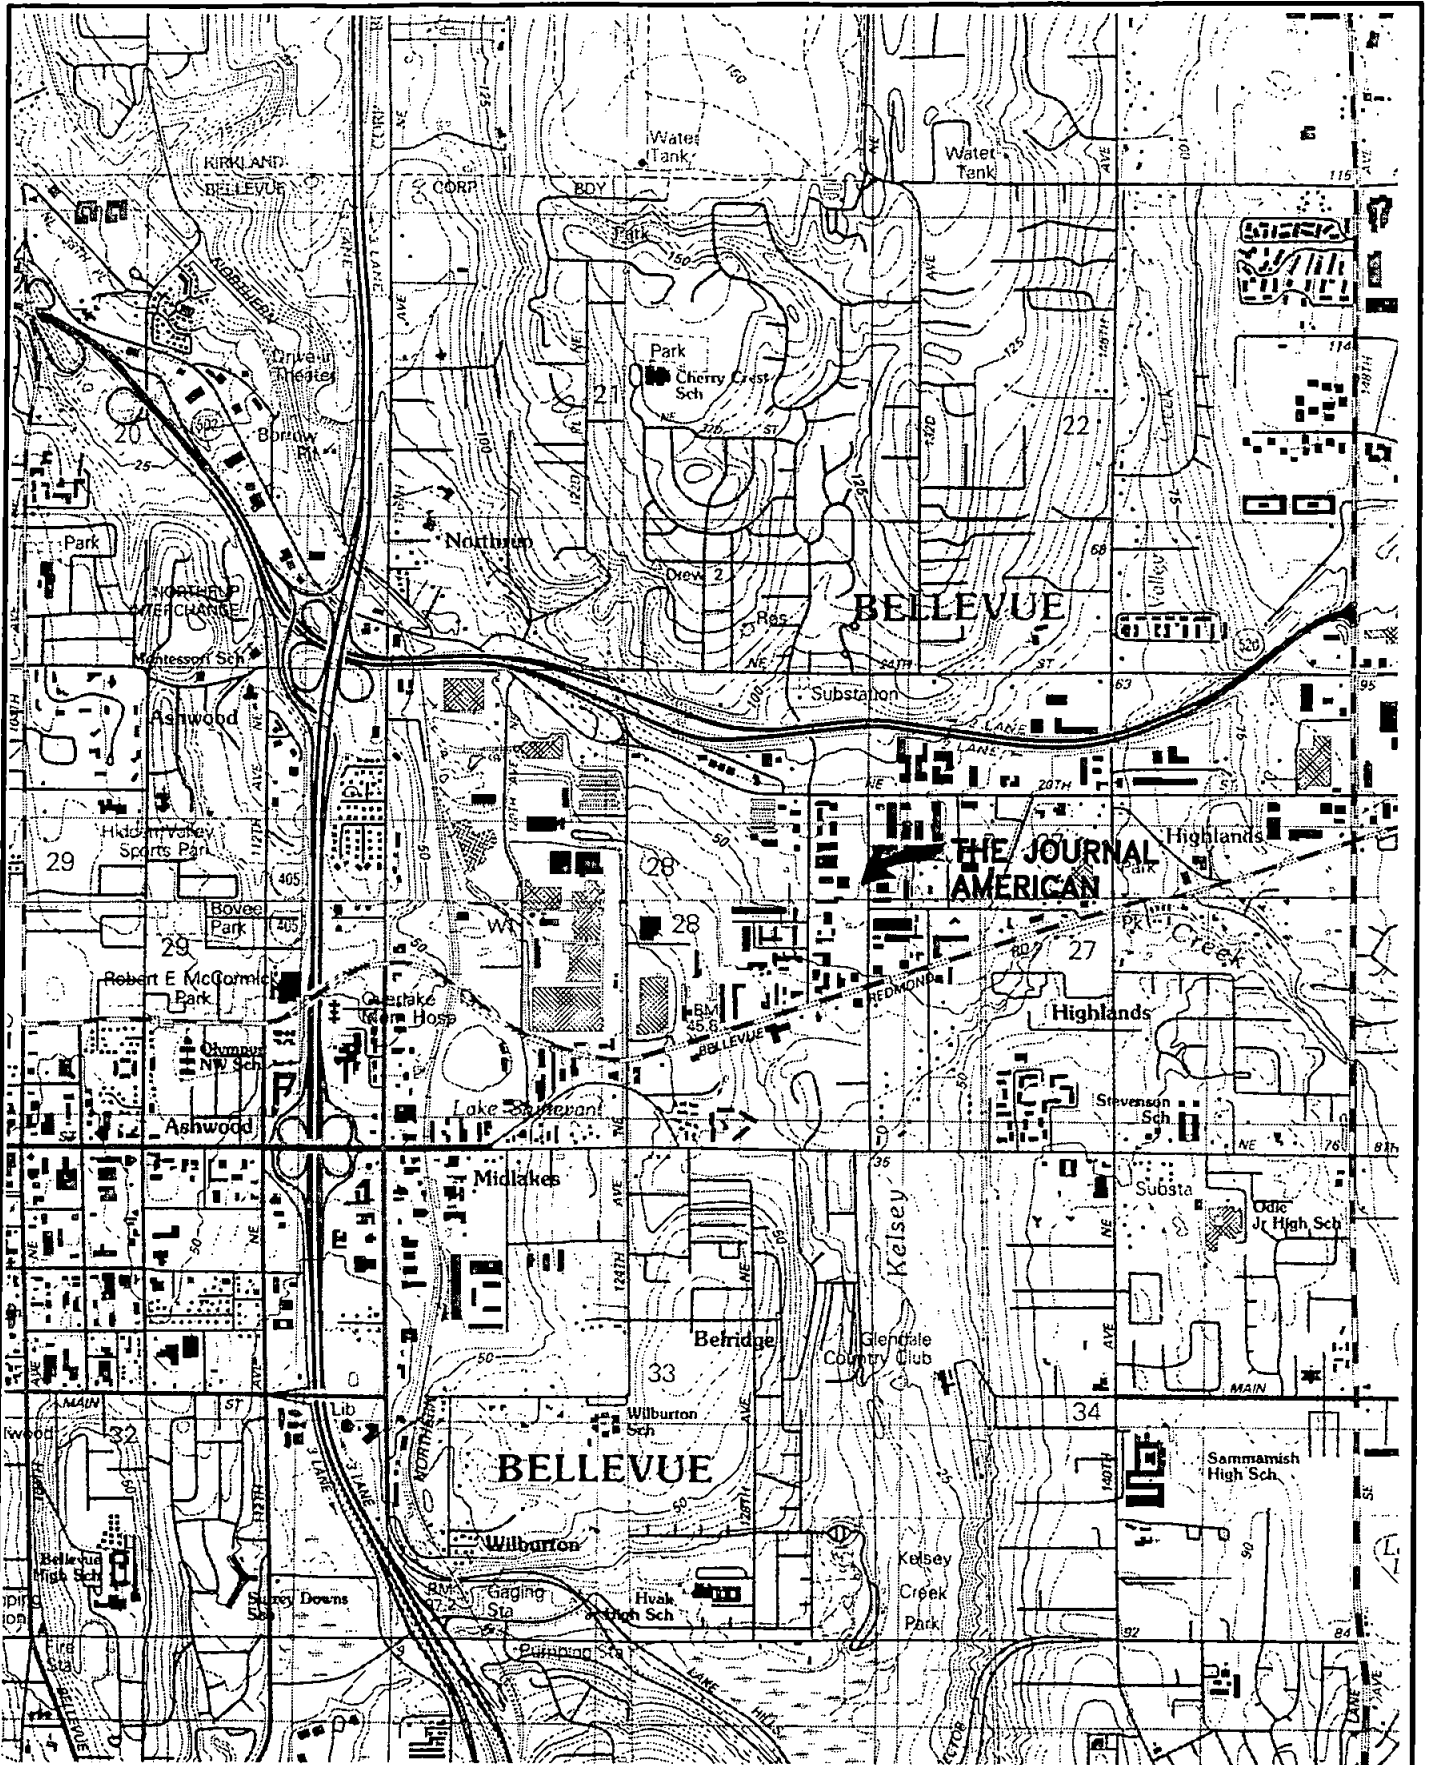

Filled sample containers were labeled with the project name, sample number, analysis to be performed, date and time of collection, and the sample processor's initials. Samples were placed on ice in an ice chest and packed with foam, bubble wrap, or vermiculite to prevent container breakage. A chain-of-custody form was completed, placed in a sealed bag, and taped to the inside lid of the ice chest. The chest was then sealed shut with fiber-reinforced tape and hand-delivered to the laboratory within 24 hours of sample collection. To retain sample integrity, the samples remained in sight of field personnel or in a locked location at all times until they were hand-delivered to the laboratory.

13.3 Hazardous Substance Identification and Quantities Related to the Independent Remedial Action

No activities associated with the current operation of The Journal American newspaper publishing facility are related to the releases addressed in this report. Contamination at the site is believed to be from releases associated with underground storage tanks used at the site by a trucking and construction company. Material management and handling practices of these previous site operators was not discovered during the course of the site investigation. Fuel dispensing activities and storage of petroleum-related products in underground storage tanks at the site were conducted prior to the newspaper's acquisition of the site and construction of the press building in 1983. Fuel dispensing operations were ceased some time prior to 1983 when the press building was constructed. The two north underground storage tanks were decommissioned in 1989.

JA-SNDST	JA-SUST-ESW	7.0	NA		190	

NA - Not Analyzed

ND - The constituent was not detected at the corresponding quantitation limit

J - The result given is estimated

E - The concentration of the constituent exceeded the calibration range of the instrument

T - The constituent does not appear to be "typical" product.

D1 - Hydrocarbons in the heavy oil range are present in the sample and are elevating the Diesel result

DATA QUALIFIER FLAGS

- J: The analyte was analyzed for and positively identified, but the associated numerical value is an estimated quantity.
- B1: This analyte was also detected in the associated method blank. The reported sample results have been adjusted for moisture, final extract volume, and/or dilutions performed during extract preparation. The analyte concentration was evaluated prior to sample preparation adjustments, and was determined not to be significantly higher than the associated method blank (less than ten times the concentration reported in the blank).
- B2: This analyte was also detected in the associated method blank. However, the analyte concentration in the sample was determined to be significantly higher than the method blank (greater than ten times the concentration reported in the blank).
- E: The concentration of this analyte exceeded the instrument calibration range.
- D: The reported result for this analyte is calculated based on a secondary dilution factor.
- X1: Contaminant does not appear to be "typical" product. Elution pattern suggests it may be _____.
- X2: Contaminant does not appear to be "typical" product. Further testing is suggested for identification.
- J: Identification and quantification of peaks was complicated by matrix interference; GC/MS confirmation is recommended.
- X4: RPD for duplicates outside advisory QC limits. Sample was re-analyzed with similar results.
- X4a: RPD for duplicates outside advisory QC limits due to analyte concentration near the method practical quantitation limit/detection limit.
- X5: Matrix spike was diluted out during analysis.
- X6: Recovery of matrix spike outside advisory QC limits. Sample was re-analyzed with similar results.
- X7: Recovery of matrix spike outside advisory QC limits. Matrix interference is indicated by blank spike recovery data.
- X7a: Recovery and/or RPD values for MS/MSD outside advisory QC limits due to high contaminant levels.
- X8: Surrogate was diluted out during analysis.
- X9: Surrogate recovery outside advisory QC limits due to matrix composition.
- X10: Blank spike recovery outside advisory QC limits.
- X11: Blank spike/blank spike duplicate RPD outside advisory QC limits.

DATA QUALIFIER FLAGS

- J: The analyte was analyzed for and positively identified, but the associated numerical value is an estimated quantity.
- B1: This analyte was also detected in the associated method blank. The reported sample results have been adjusted for moisture, final extract volume, and/or dilutions performed during extract preparation. The analyte concentration was evaluated prior to sample preparation adjustments, and was determined not to be significantly higher than the associated method blank (less than ten times the concentration reported in the blank).
- B2: This analyte was also detected in the associated method blank. However, the analyte concentration in the sample was determined to be significantly higher than the method blank (greater than ten times the concentration reported in the blank).
- E: The concentration of this analyte exceeded the instrument calibration range.
- D: The reported result for this analyte is calculated based on a secondary dilution factor.
- X1: Contaminant does not appear to be "typical" product. Elution pattern suggests it may be _____.
- X2: Contaminant does not appear to be "typical" product. Further testing is suggested for identification.
- J3: Identification and quantification of peaks was complicated by matrix interference; GC/MS confirmation is recommended.
- X4: RPD for duplicates outside advisory QC limits. Sample was re-analyzed with similar results.
- X4a: RPD for duplicates outside advisory QC limits due to analyte concentration near the method practical quantitation limit/detection limit.
- X5: Matrix spike was diluted out during analysis.
- X6: Recovery of matrix spike outside advisory QC limits. Sample was re-analyzed with similar results.
- X7: Recovery of matrix spike outside advisory QC limits. Matrix interference is indicated by blank spike recovery data.
- X7a: Recovery and/or RPD values for MS/MSD outside advisory QC limits due to high contaminant levels.
- X8: Surrogate was diluted out during analysis.
- X9: Surrogate recovery outside advisory QC limits due to matrix composition.
- N: See analytical narrative.

DATA QUALIFIER FLAGS

- J: The analyte was analyzed for and positively identified, but the associated numerical value is an estimated quantity.
- B1: This analyte was also detected in the associated method blank. The reported sample results have been adjusted for moisture, final extract volume, and/or dilutions performed during extract preparation. The analyte concentration was evaluated prior to sample preparation adjustments, and was determined not to be significantly higher than the associated method blank (less than ten times the concentration reported in the blank).
- B2: This analyte was also detected in the associated method blank. However, the analyte concentration in the sample was determined to be significantly higher than the method blank (greater than ten times the concentration reported in the blank).
- E: The concentration of this analyte exceeded the instrument calibration range.
- D: The reported result for this analyte is calculated based on a secondary dilution factor.
- X1: Contaminant does not appear to be "typical" product. Elution pattern suggests it may be _____.
- X2: Contaminant does not appear to be "typical" product. Further testing is suggested for identification.
- .3: Identification and quantification of peaks was complicated by matrix interference; GC/MS confirmation is recommended.
- X4: RPD for duplicates outside advisory QC limits. Sample was re-analyzed with similar results.
- X4a: RPD for duplicates outside advisory QC limits due to analyte concentration near the method practical quantitation limit/detection limit.
- X5: Matrix spike was diluted out during analysis.
- X6: Recovery of matrix spike outside advisory QC limits. Sample was re-analyzed with similar results.
- X7: Recovery of matrix spike outside advisory QC limits. Matrix interference is indicated by blank spike recovery data.
- X7a: Recovery and/or RPD values for MS/MSD outside advisory QC limits due to high contaminant levels.
- X8: Surrogate was diluted out during analysis.
- X9: Surrogate recovery outside advisory QC limits due to matrix composition.
- X10: Blank spike recovery outside advisory QC limits.
- X11: Blank spike/blank spike duplicate RPD outside advisory QC limits.

Surrogate A is Trifluorotoluene.

Surrogate B is Bromobenzene.

Values reported in ppm (mg/L).

Quantitation on total peaks in the gasoline range from Toluene to C12.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- NR Indicates no recovery due to matrix interference.

Reported: 11/01/94

Date analyzed: 11/01/94

Volume Purged: 5.0 mL
Dilution: 1:1

Reported in ppb (ug/L)

CAS Number	Analyte	Value
71-43-2	Benzene	0.9 J
108-88-3	Toluene	1.0 U
100-41-4	Ethylbenzene	4.6
	m,p-Xylene	5.1
95-47-6	o-Xylene	7.0

BETX 8020 Surrogate Recovery

Trifluorotoluene	92.9%
Bromobenzene	91.3%

Data Qualifiers

- U Indicates compound was analyzed for, but not detected at the given detection limit.
- J Indicates an estimated value when that result is less than the calculated detection limit.
- E Indicates a value above the linear range of the detector.
Dilution Required
- S Indicates no value reported due to saturation of the detector.
- D Indicates the surrogate was diluted out.
- B Found in associated method blank.
- Y Indicates a raised detection limit due to matrix interference.
- NA Indicates compound was not analyzed.
- NR Indicates no recovery due to interferences.

Values reported in ppm (mg/L).

Surrogate is Methyl Arachidate.

Gas value based on total peaks in the range from Toluene to C12.

Diesel value based on the total peaks in the range from C12 to C24.

Oil value based on the total peaks in the range from C24 to C32.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- C Indicates a probable value which cannot be confirmed due to matrix interference.
- NR Indicates no recovery due to matrix interference and/or dilution.

CAS Number	Analyte	Value
71-43-2	Benzene	1.2
108-88-3	Toluene	1.0 U
100-41-4	Ethylbenzene	7.5
	m,p-Xylene	10
95-47-6	o-Xylene	9.0

BETX 8020 Surrogate Recovery

Trifluorotoluene	86.1%
Bromobenzene	88.1%

Data Qualifiers

- U Indicates compound was analyzed for, but not detected at the given detection limit.
- J Indicates an estimated value when that result is less than the calculated detection limit.
- E Indicates a value above the linear range of the detector.
Dilution Required
- S Indicates no value reported due to saturation of the detector.
- D Indicates the surrogate was diluted out.
- B Found in associated method blank.
- Y Indicates a raised detection limit due to matrix interference.
- NA Indicates compound was not analyzed.
- NR Indicates no recovery due to interferences.

J002E	MW-5	11/23/94	1:1	10 U	10 U	25 U	124%

Values reported in ppm (mg/L).

Surrogate is Methyl Arachidate.

Gas value based on total peaks in the range from Toluene to C12.

Diesel value based on the total peaks in the range from C12 to C24.

Oil value based on the total peaks in the range from C24 to C32.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- C Indicates a probable value which cannot be confirmed due to matrix interference.
- NR Indicates no recovery due to matrix interference and/or dilution.

108-88-3	Toluene	1.0 U
100-41-4	Ethylbenzene	6.9
	m,p-Xylene	7.6
95-47-6	o-Xylene	8.0

BETX 8020 Surrogate Recovery

Trifluorotoluene	94.9%
Bromobenzene	97.8%

Data Qualifiers

- U Indicates compound was analyzed for, but not detected at the given detection limit.
- J Indicates an estimated value when that result is less than the calculated detection limit.
- E Indicates a value above the linear range of the detector.
Dilution Required
- S Indicates no value reported due to saturation of the detector.
- D Indicates the surrogate was diluted out.
- B Found in associated method blank.
- Y Indicates a raised detection limit due to matrix interference.
- NA Indicates compound was not analyzed.
- NR Indicates no recovery due to interferences.

Values reported in ppm (mg/L).

Surrogate is Methyl Arachidate.

Gas value based on total peaks in the range from Toluene to C12.

Diesel value based on the total peaks in the range from C12 to C24.

Oil value based on the total peaks in the range from C24 to C32.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- C Indicates a probable value which cannot be confirmed due to matrix interference.
- NR Indicates no recovery due to matrix interference and/or dilution.

Bromobenzene 95.1%

Data Qualifiers

- U Indicates compound was analyzed for, but not detected at the given detection limit.
- J Indicates an estimated value when that result is less than the calculated detection limit.
- E Indicates a value above the linear range of the detector.
Dilution Required
- S Indicates no value reported due to saturation of the detector.
- D Indicates the surrogate was diluted out.
- B Found in associated method blank.
- Y Indicates a raised detection limit due to matrix interference.
- NA Indicates compound was not analyzed.
- NR Indicates no recovery due to interferences.

Appendix C
Geotechnical Considerations for Excavation Options

TO: Janeen Adamo/PDX
FROM: Kevan Sharp/SEA
DATE: June 15, 1995
SUBJECT: Journal American - Geotechnical Recommendations
PROJECT: 117439.IR.PL

The purpose of this memorandum is to provide geotechnical recommendations relative to the removal of the petroleum hydrocarbon contaminated soil at The Journal American Press Building, Bellevue, Washington. It is CH2M HILL's understanding that the remediation work that is under consideration is restricted to the portion outside of the building. The contamination beneath the building will remain in place until a future time when the building is demolished. This memorandum is intended to provide recommendations for excavation, shoring and groundwater control, considering site restrictions, settlement considerations of the Press Building, and settlement considerations of the printing operation.

That portion of the contamination which is outside of the building is thought to exist immediately south of the building. Two areas of contamination are under investigation based on current information. The smallest area, which may be anomalous, is south of the building near the southwest corner and west of the south loading ramp. The larger area, east of the loading ramp, is thought to extend from the overhead door to about 40 ft east to the mechanical room and approximately 15 feet south of the building. Both areas have contamination in the 7 to 10 ft depth range.

Soil conditions at the site consist of medium dense granular fill material containing some cobbles and gravel from about ground surface to about 7 ft depth. Below 7 ft is native material consisting of medium dense interbedded granular fine grained sand and nonplastic silt. Groundwater has been measured at various piezometers on site and has been found to range from 7 to 10 feet below ground surface, depending on location and season.

The source of the contamination is thought to have originated prior to the current site development. Prior to The Journal American Press Building construction, a trucking facility's buried fuel tanks and a fuel pump island were located in the immediate vicinity of the known contamination. It is our understanding that as the site was developed for The Journal American, the buried tanks were removed but the contaminated soil was left in place.

Structural Constraints

The current methodology under consideration for remediation is to excavate the contaminated soil and replace with clean backfill. Excavation methodologies under consideration include open cut or shored excavation. Site constraints that have been identified include:

MEMORANDUM

Page 2

June 15, 1995

- An adjacent property to the west of The Journal American property has a concrete masonry building (CMU) in the immediate vicinity of the property line. Any excavation and shoring must be performed in such a way as to limit settlement at the property line so as not to impact the neighboring building. CMU buildings are highly susceptible to cracking and have little tolerance for settlement. Settlement at the property line should be limited to less than .005 feet (1/16 inch).
- The portion of The Journal American Press Building that would be affected by the excavation is along the south wall. This portion of the building is founded on strip footings. Depth of the strip footings ranges from 2 to 6 feet. The footings step down from 2 to 4 to 6 feet as they approach the loading ramp from east to west, and then step back up from 6 to 4 to 2 feet from the loading ramp toward the south west corner of the building. This portion of the building has relatively light loads since the south wall is not a bearing wall. Considering the type of structure, its tolerance for settlement is in the range of .02 to .03 feet (1/4 to 1/8 inch).
- The strip footings require soil support in an envelope extending downward from the footing at a 1:1 slope. No excavations should be performed within the zone of influence of the footing without review by a structural engineer. Any excavation intruding into the zone of influence should be shored with a structural system designed by a registered structural engineer.
- Within The Journal American building is the printing press itself. The south end of the printing press is about 11 feet north of the south wall. Based upon information obtained from The Journal American, the printing press itself has extremely tight tolerances for alignment and is essentially intolerant of any settlement. Any excavation or shoring system that has a potential of inducing settlement of the printing press is not be allowed.
- The main electrical feed to the printing press is buried along the south wall. It is unknown what the condition of the electrical feed is in, how it was constructed, and what its tolerances might be for settlement.

MEMORANDUM

Page 3

June 15, 1995

- Other nonstructural constraints have been identified such as site access, parking, duration of construction, access to mechanical equipment, etc. Since those constraints are non-structural, they have not been considered in this memorandum.

Open Cut Excavation

The open cut excavation option under consideration consists of performing an unshored excavation to a depth of 10 feet to remove the contaminated soil at both areas. It is desirable to excavate the slopes to as steep as possible to maximize the volume of contaminated soil being removed. OSHA guidelines for unshored excavations limit the slopes to be no steeper than 1.5:1. Considering the nature of the soil at this site, a stable excavation slope should not exceed 1.75:1 for long term exposure (e.g. --days). It is permissible to temporarily (e.g. -days) oversteepen a 1.75:1 slope to 1.5:1 in short segments provided the oversteepened portion is limited to a 5 ft width and is immediately restored to a 1.75:1 slope.

The advantages to the open cut excavation are that the duration of the work can be limited to a short time since the work is fairly simple and does not involve installation of shoring elements. An open cut excavation at 1.75:1 should not induce any measurable settlement at the adjacent property to the west and along the south wall of The Journal American Press Building.

The main disadvantage to the open cut system is that the volume of contaminated soil that can be removed is approximately 1/3 of the total volume that is thought to exist outside of the building.

Shored Excavation

Shoring of the excavation provides opportunity to increase the volume of contaminated soil that can be safely removed. Shoring systems that are feasible at this site consist of drilled or jetted in place shoring. Use of vibratory or impact driving equipment should not be allowed since the induced vibrations could cause unacceptable settlements of the neighboring property or the printing press. When shoring is installed, most shoring systems will deflect outward a small amount and some corresponding settlement will occur. The settlement and deflection are controlled by selecting a shoring method that is less susceptible to movement or to a lesser degree by increasing the stiffness of the shoring system. Settlement generally occurs at a distance equal to the depth of excavation and decreases to zero at a distance of twice the excavation depth. The two feasible types of shoring systems include jet-grout shoring and soldier pile and lagging shoring.

MEMORANDUM

Page 4

June 15, 1995

The jet grouting shoring involves injecting a grout/air slurry mixture using a rotating jet while simultaneously extracting soil. The jet grouting operation results in 2-3 ft diameter grout piles and can be installed to provide continuous support and intimate contact with the structure footing. The patented jet grouting method provided by Hayward Baker provides the most risk free type of shoring relative to inducing settlement of a footing. That is because the shoring is installed with little influence on footings or soil as it is jetted in place and is rigid (stiff) enough that little deflection of the wall system occurs as excavation proceeds. A jet-grouted wall would probably deflect and settle no more than .005 ft (1/16 inch) at the wall face. Hayward Baker jet grouting shoring has been successfully performed locally on structures that have settlement tolerances similar to those at this site.

Soldier pile and lagging shoring uses an auger to install a vertical steel H beams (soldier piles) on horizontal spacing of 8 to 10 feet typically. As excavation proceeds, wood lagging is installed to provide excavation face support spanning between the soldier piles. Wall stiffness is controlled by the size of the wide flange beams and their spacing. At this site, the maximum height of a cantilever soldier pile and lagging wall is 4 to 6 feet, depending on the spacing and size of the soldier piles, distance from the footing, and backslope behind the wall.

For excavation depths exceeding the 4 to 6 feet, tieback anchors or bracing are necessary. Tieback anchors are drilled through the wall (in this case under the structure) and are grouted in and pretensioned prior to continuing on with excavation. The pretensioning force provides sufficient resistance to maintain a stable wall face. Since the soldier pile wall is more flexible than the jet grout wall, it will have more movement both laterally and vertically. Both of these types of deflection can be decreased by increasing wall stiffness but cannot be eliminated. The wall would move outward about .2% of the wall height (1/4 inch) and vertically about .15% of wall height (0.2 inches). Movement could be felt up to twice the excavation depth or, in our case, 20 feet away from the wall, decreasing linearly from its maximum up to 10 feet away to zero 20 feet away.

Where the shoring is less than 20 feet away from the press or other settlement sensitive structures, a stiffer wall consisting of continuous soldier piles may be necessary. Tieback anchors underneath the printing press should be avoided to preclude any deformations that might occur as a result of installing the tieback anchor. They would also be difficult to install along the west property boundary since it would require obtaining an easement from the neighboring property owner. Neither of these two concerns present a significant risk since the limits of the contamination would not require tiebacks at the printing press or along the west property line. If during remediation contamination is found to extend beyond the currently envisioned boundaries, it would be necessary to continue the excavation as an open cut beyond any shoring boundaries since the shoring contractor would have demobilized from the site.

Each of the wall systems discussed herein have some inherent risk associated with inducing unacceptable movement of the press or of the neighboring CMU building. Either of them could be installed within the tolerances of The Journal American structure itself. Of the two

MEMORANDUM

Page 5

June 15, 1995

systems, the jet grouting system has the highest cost but also provides the least risk to the facility. It would be difficult to provide a "guarantee" that either system could be controlled so that there would be no impact to the printing press. However, the jet grouting system has a track record that shows it should be able to meet the settlement criteria. The soldier pile system should also be able to be designed and installed to meet the settlement tolerances provided shoring is not required in the vicinity of the press. However there would be more uncertainty of its performance, and thus a greater risk. In terms of costs, the jet grouting system is expected to cost about \$200,000 for shoring installation. A soldier pile wall could be installed for about \$60,000.

Another option that could be considered involves a combination of open cut and shoring. Open cutting could be performed from the edge of the building to a point where soldier pile shoring could be installed resulting in a 4 ft high wall. The advantages of this approach would be to reduce the need for tiebacks, decrease the cost of shoring and move the shoring system as far away as possible from the structures to minimize settlement effects of the shoring. The disadvantage is that it does not maximize the removal of contaminated soil outside of the building.

Groundwater Control

For any excavation groundwater seepage can have a significant effect on excavation stability. Seepage along the face of an open cut excavation is unacceptable since water pressures reduce stability and can cause erosion or piping of the soil. Groundwater should be adequately controlled to preclude any seepage at the face. For shored excavations, it is important that groundwater is allowed to drain through the wall face to preclude differential water pressure. In either case, groundwater will need to be controlled within the excavation since it is expected to be encountered at an elevation higher than the bottom of the excavation. Groundwater control would be performed by installing shallow wells or well points. Excavation could be completed to the groundwater table prior to installing 2 to 3 ft diameter 4 ft deep wells. Once the wells have been operating for a short period of time (1 to 3 days) excavation could proceed to the maximum depth. If any seepage is observed as excavation proceeds, remedial action should be taken immediately by adding a well where seepage is observed. Groundwater should be pumped to onsite water storage where it should be tested for quality prior to disposal.

Summary

Of the options described above, the most risk free option relative to impacting the operation of the printing press and neighboring property is the open cut excavation. Clearly, the open cut option also results in removing a minimal amount of the contamination and the remainder would be removed when the rest of the contamination currently under the existing building is excavated. One has to consider the reasonableness of performing this work in view of the fact that a high percentage of the contamination will continue to exist for later remediation.

MEMORANDUM

Page 6

June 15, 1995

With regard to using shoring to maximize the volume of contaminated soil to be removed, the risks of effecting the printing press must be considered. The jet grouting option provides the most risk-free system and has a relatively high cost. Again, the economic viability of performing this type of exercise should be considered keeping in mind that again there will still be a significant amount of contamination left on site for future removal.

None of the systems described addresses the risk to the main electrical power feed to the printing press. Since its condition and tolerance for settlement is unknown, any work in this area provides some risk, but the amount is difficult to quantify. Again, the safest approach is to perform the work in such a way as to minimize the amount of movement that would occur. This would be in terms of increasing risk: open cut, open cut/shore combination, jet grout shoring, and soldier pile shoring.

ATTENTION: Mr. Glen Vedera

RE: GEOPHYSICAL SURVEY FOR A UST AT THE JOURNAL AMERICAN
BUILDING, BELLEVUE, WASHINGTON

Dear Mr. Vedera:

This letter report summarizes the geophysical survey performed at the Journal American Building, Bellevue, Washington on May 24, 1995 by Golder Associates Inc. of Redmond, Washington.

The purpose of the survey was to assess the location of a possible underground storage tank (UST) that was encountered during boring activities at the site. Also, the location of other possible UST's and/or buried utilities needed to be assessed prior to future intrusive work.

EQUIPMENT AND METHODS

Golder Associates used ground-penetrating radar (GPR), magnetic, and electromagnetic (EM) techniques to search for these buried objects. The geophysical equipment consisted of the following: GSSI SIR System-4 GPR system with 120 and 500 MHz antennas, Grainger G-101 magnetometer, Radiodetection RD400 utility locator, and Geonics EM31 terrain conductivity meter.

The survey was conducted within 30 feet of the south wall of the Journal American building (Appendix A). A grid was established in this area using blue paint marks at the 10-foot nodes and was referenced to the south wall. The gridded area extended from the eastern edge of the loading ramp to the southeast corner of the building. A grid was not established to the west of the loading ramp because of the storage box, dumpsters, and vending machines and other obstacles. However, reconnaissance level surveys were performed in this area. All of the geophysical equipment were tested and the GPR

and Radiodetection equipment proved to be the most useful, with the maximum penetration of the GPR estimated to be 8 feet. The EM31 and Grainger magnetometer were not effective within 15 feet of the south wall or to the west of the loading ramp because of the interference from the building, storage box and other metallic objects.

GEOPHYSICAL SURVEY RESULTS

Three anomalous areas were detected with the geophysical equipment. Two linear anomalies, oriented east to west, were located 5 and 8 feet from the building with the GPR. One anomaly was located south of the storage box on the west side of the loading ramp with the Radiodetection utility locator (see Appendix A). All anomalies were marked in the field with orange paint and pink chasers.

The GPR anomaly located 5 feet from the building is approximately 6 to 8 feet deep and extends between 38 E and 48 E on the geophysical grid. This anomaly is in the area that had been excavated to a depth of approximately 7 feet and backfilled prior to the geophysical surveys. It is interpreted to be the interface between the fill and the original soil at the bottom of the excavation. This anomaly also corresponds to a hard flat surface encountered in a borehole at a depth of 10 feet. However, the depth of the GPR anomaly is too shallow to be an object at 10 feet. The GPR anomaly at a depth of 8 feet located south of the building corresponds with the approximate location of a storm drain pipe that connects to a drain at the loading ramp. This pipe was also encountered during the excavation of this area (pers. comm., Journal American personnel). It could not be determine whether either of these GPR anomalies were metallic because of interference from the building.

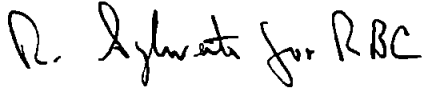

The Radiodetection anomaly west of the loading ramp is possibly an abandoned cable or rebar. It is unclear whether this anomaly is related to the abandoned electrical outlet box to the west because no connection could be confirmed with the Radiodetection system. The source of this anomaly probably has a small diameter, less than 1 inch, because it was not detected with the GPR.

No UST or other large buried objects, other than the storm drain, were detected within 8 feet of the surface in the survey area east of the loading ramp. No large buried metallic objects were detected in the survey area beyond 15 feet of the south wall. However, the presence of buried objects could not be determined within 15 feet of the building or in the area west of the loading ramp because of the presence of metallic surface objects. Also, it was not possible to confirm if the object encountered in the borehole was metallic because of the proximity to the south wall. If the borehole had been not been back filled, a sensor could have been lowered into the hole to determine if this object was metallic.

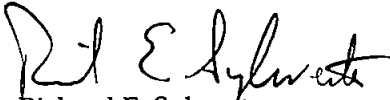

We appreciated this opportunity to work with you on this project. If you have any questions please feel free to call us at (206) 883-0777.

Sincerely,

GOLDER ASSOCIATES INC.

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following Standard Operating Procedures and our Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI releases ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the client.

Subject: August 1995 Groundwater Sampling at The Journal American Site, Bellevue, Washington [TCP ID No. 309717]

Dear Elaine:

This letter presents the August 1995 groundwater sampling results and a summary of the groundwater compliance monitoring conducted at The Journal American Newspaper facility, Bellevue, Washington. As you are aware, an Independent Remedial Action was completed at The Journal American and an Independent Remedial Action Report (IRAR) was submitted to the Washington Department of Ecology (Ecology) on August 17, 1995. This letter supplements the IRAR submittal.

The August 1995 groundwater sampling results indicate no petroleum-hydrocarbon related parameters in excess of Model Toxic Control Act (MTCA) Method A or Method B cleanup levels for groundwater. These results are consistent with the groundwater sampling conducted monthly from September 1994 through February 1995, which also indicate there are no petroleum-hydrocarbon related parameters in excess of MTCA Method A cleanup levels. Previous groundwater sampling results and a compliance monitoring methodology are presented in the IRAR and revised Table 10 (attached).

With these August 1995 sampling results, groundwater samples have been taken at the site for seven of the past twelve months. Sampling was conducted during the wettest and driest times of the year and all sampling results are below MTCA Method A cleanup levels.

The source of petroleum-contaminated soils remaining in place at The Journal American facility was an underground storage tank and fuel dispensing island. These structures were removed before the construction of The Journal American press building in 1983. The remedial action (soil removal) undertaken at The Journal American utilizes the Press

Serving Oregon and Southwest Washington from two locations:

Portland Office 825 N.E. Multnomah, Suite 1300, Portland, OR 97232-2146
Corvallis Office 2300 NW Walnut Blvd., Corvallis, OR 97330-3538

503.235.5000
503.752.4271

503.235.2445 FAX
503.752.0276 FAX

Building and adjacent parking area as containment for the contaminated soils. In effect, the press building and paved parking area began serving as a cap in 1983 when they were built over the petroleum contaminated soils. Seven months of sampling results, obtained 12 years after the source was removed and capped, demonstrate the effectiveness of this containment.

Based upon these results, it is CH2M HILL's opinion that further groundwater sampling at the facility is unwarranted. Therefore, on behalf of our client, Persis Corporation, CH2M HILL requests that Ecology concur that no further compliance monitoring be required at the site and that a No Further Action determination be issued for the property.

Groundwater Sampling Protocol

Groundwater samples were collected in accordance with the Workplan developed for the groundwater monitoring program at the site. The most recent static groundwater levels in each well were measured before field sampling. Groundwater static water levels are presented in Table 1. Monitoring well locations and groundwater flow gradients are presented in Figure 10 of the IRAR (CH2M HILL, August 1995).

Table 1 Groundwater Static Levels August 22, 1995 The Journal American			
Monitoring Well Number	Time	Total Depth (feet)	Depth to Water (feet)
MW-1	14:29	19.75	11.39
MW-2	14:33	13.69	7.77
MW-3	14:37	15.68	7.85
MW-4	14:41	19.54	9.46

The monitoring wells were purged by extracting three casing volumes of groundwater with a Voss brand disposable polyethylene bailer attached to 100# test nylon fishing line. A new bailer was used for each well. After each casing volume was purged, pH, conductivity, and temperature were checked as indicators of groundwater stability. In all cases, the third casing volume parameters were within 10% of the second casing volume parameters, indicating stable well conditions. Approximately 21 gallons of purge water was placed in a labeled, steel, 55-gallon, open-top-style drum, and left onsite.

Analytical Results

Groundwater samples were delivered to Analytical Resources, Inc., Seattle, Washington for environmental analysis. Samples from each monitoring well were analyzed for a suite of constituents using the methods indicated below:

- Total Petroleum Hydrocarbons; gasoline and diesel extended (WTPH-G and WTPH-D)
- Volatile Organic Compounds (EPA Method 8260)

Analytical results from the August 1995 groundwater sampling, indicated no petroleum-hydrocarbon related parameters in excess of MTCA Method A cleanup levels for groundwater. Analytical results are summarized in Table 2 and laboratory summary reports are provided in Attachment A. A revised Table 10 for the IRAR report, which includes the August 1995 data, is attached.

Monitoring well MW-3 and a quality control duplicate of monitoring well MW-3, detected low concentrations of the volatile organic compounds: naphthalene, sec-butylbenzene, n-propylbenzene, 1,3,5-trimethylbenzene, 1,2,4-trimethylbenzene, and isopropyl benzene. MTCA Method A cleanup levels for these constituents have not been established. A groundwater cleanup level of 320 µg/L for naphthalene was calculated using MTCA Method B criteria. Calculations are included in Attachment B for reference and the cleanup criteria is indicated in Table 2. Naphthalene was detected at 6.9 and 7.8 µg/L in MW-3 and the duplicate of MW-3. These detected concentrations are two orders of magnitude below the calculated Method B cleanup level.

No toxicity factors are available for the constituents sec-butylbenzene, n-propylbenzene, 1,3,5-trimethylbenzene, 1,2,4-trimethylbenzene, and isopropyl benzene in the US Environmental Protection Agency's Integrated Risk Information System (IRIS) nor in the Health Effect Summary Tables (Risk Assessment Guidance for Superfund, Human Health Evaluation Manual, Part A (October 1989)) (HEST). Therefore, no Method B cleanup level could be calculated for these constituents. According to Phil Bebee of Analytical Laboratory, Inc., these constituents are residual gasoline products and are typically found at old gasoline-contaminated sites. This is consistent with the historical use of underground storage tanks for

Ms. Elaine P. Atkinson
Page 4
September 21, 1995
117439.IR.RP

fuel dispensing at the facility prior to 1983. In as much as there are neither MTCA Method A cleanup criteria for these constituents nor are they listing in IRIS or HEST and the highest encountered value was 6.1 µg/L; it is CH2M HILL's opinion that they do not present a threat to human health or the environment.

Summary

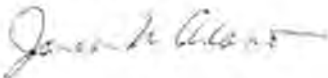

In addition to the August 1995 groundwater sampling results presented in this report, groundwater sampling was conducted monthly from September 1994 through February 1995. None of the seven months of sampling results are in excess of MTCA cleanup levels for groundwater. The sampling was conducting during the wettest and driest times of the year, in a year that saw higher than normal amount of precipitation.

These sample results demonstrate the effectiveness of The Journal American press building and parking area to contain the contaminated soil remaining onsite during the 12 years since underground storage tank and fuel dispensing island were removed in 1983. CH2M HILL believes this monitoring satisfies Ecology's requirement that groundwater compliance monitoring demonstrate the long-term effectiveness of the chosen remedial action without the need for additional sampling. It is CH2M HILL's further opinion that a No Further Action determination should be issued by Ecology for this site.

If you have any questions on the information contained in this letter report, or that attached analytical reports, please feel free to telephone me at 503/235-5022, ext. 4360. As we discussed during the August 17, 1995 meeting, Ecology's determination for this site is needed before the end of the month. To assist Ecology in meeting this schedule, I will contact you on September 27, 1995 to discuss your review of the findings presented in this letter and the IRAR.

Sincerely,

CH2M HILL

Janeen M. Adamo

Surrogate A is Trifluorotoluene.
Surrogate B is Bromobenzene.
Values reported in ppm (ug/L).
Quantitation on total peaks in the gasoline range from Toluene to C12.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- NR Indicates no recovery due to matrix interference.

Subject: Summary of Fourth Quarter 1995 Groundwater Sampling and Asphalt Cap Installation at The Journal American Site, Bellevue, Washington [TCP ID No. 309717]

Dear Ms. Atkinson:

This letter summarizes both the analytical results from the fourth quarter 1995 (December 1995) groundwater compliance monitoring and installation of an asphalt cap at The Journal American Newspaper facility, Bellevue, Washington. As you may recall, an Independent Remedial Action was completed at The Journal American and an Independent Remedial Action Report (IRAR) was submitted to the Washington Department of Ecology (Ecology) on August 17, 1995. This letter supplements that IRAR submittal.

The following sections summarize field activities conducted at the site during the fourth quarter of 1995.

Asphalt Cap Installation

CH2M HILL contracted with Totem Paving to install an asphalt cap at The Journal American Newspaper facility in the area directly south of the Press Building. On October 30, 1995, Totem Paving excavated an area approximately ten feet wide and fifty feet long and which tapered to 4-inches deep along the southern edge of the Press Building. This area (approximately 10' by 50' tapered to 4") was excavated to allow the asphalt cap to mesh evenly with the existing Press Building floor elevation. The excavated area encompassed a portion of the parking lot and loading dock area previously investigated for possible TPH contamination.

Serving Oregon and Southwest Washington from two locations:

Portland Office	825 N.E. Multnomah, Suite 1300, Portland, OR 97232-2146	503.235.5000	503.235.2445 FAX

persts/journal/gw_5.doc

Ms. Elaine P. Atkinson

Page 2

January 24, 1996

117439.IR.RP

The excavated area was filled to provide a 4-inch thick asphalt cap as outlined in the IRAR submittal, which was approved by Ecology in an interim letter dated September 28, 1995. The area immediately surrounding the four groundwater monitoring wells was also excavated to allow for a flush finish for the new 4-inch cap. The remainder of the southern portion of the site was overlaid with an additional 2-inches of asphalt over the existing 2-inch asphalt paving to provide a consistent 4-inch cap over the entire area (see Figure 1). Vehicles were kept off of the cap for two days to allow the asphalt to properly set up. The existing concrete pads and concrete loading dock were not covered since they are impermeable surfaces, and thus serve as an effective cap.

Quarterly Groundwater Monitoring

Ecology's September 28, 1995, interim letter addressing the Independent Remedial Action required additional short term performance groundwater monitoring of two monitoring wells (MW-1 and MW-3) for three additional quarters (fourth quarter 1995 and first and second quarter 1996). Groundwater sampling and analysis for monitoring of monitoring wells MW-1 and MW-3 was to include total petroleum hydrocarbons (TPH) by analytical method WTPH-D extended (or WTPH-D and WTPH-418.1) and total or dissolved lead.

CH2M HILL conducted fourth quarter groundwater monitoring on December 19, 1995 as noted below.

Groundwater Sampling Protocol

Groundwater samples were collected in accordance with the Workplan developed for the groundwater monitoring program at the site. The static groundwater levels in all four monitoring wells were measured to confirm groundwater flow direction. The static groundwater levels in MW-1 and MW-3 were measured before initiating purging using an electronic water level indicator. The water level in these wells was measured at least twice and was repeated if the two readings did not agree to within 0.02 feet. Groundwater static water levels are presented in Table 1. Monitoring Well locations and groundwater flow gradients are presented in Figure 10 of the IRAR (CH2M HILL, August 1995).

Purge volumes for monitoring wells MW-1 and MW-3 were calculated based on the total depth of the wells and the measured static water levels. These two monitoring wells were then purged and sampled using a Grundfos Rediflo 2 sampling pump. A Honda generator was used to power the Grundfos unit. The gasoline engine driven generator was positioned

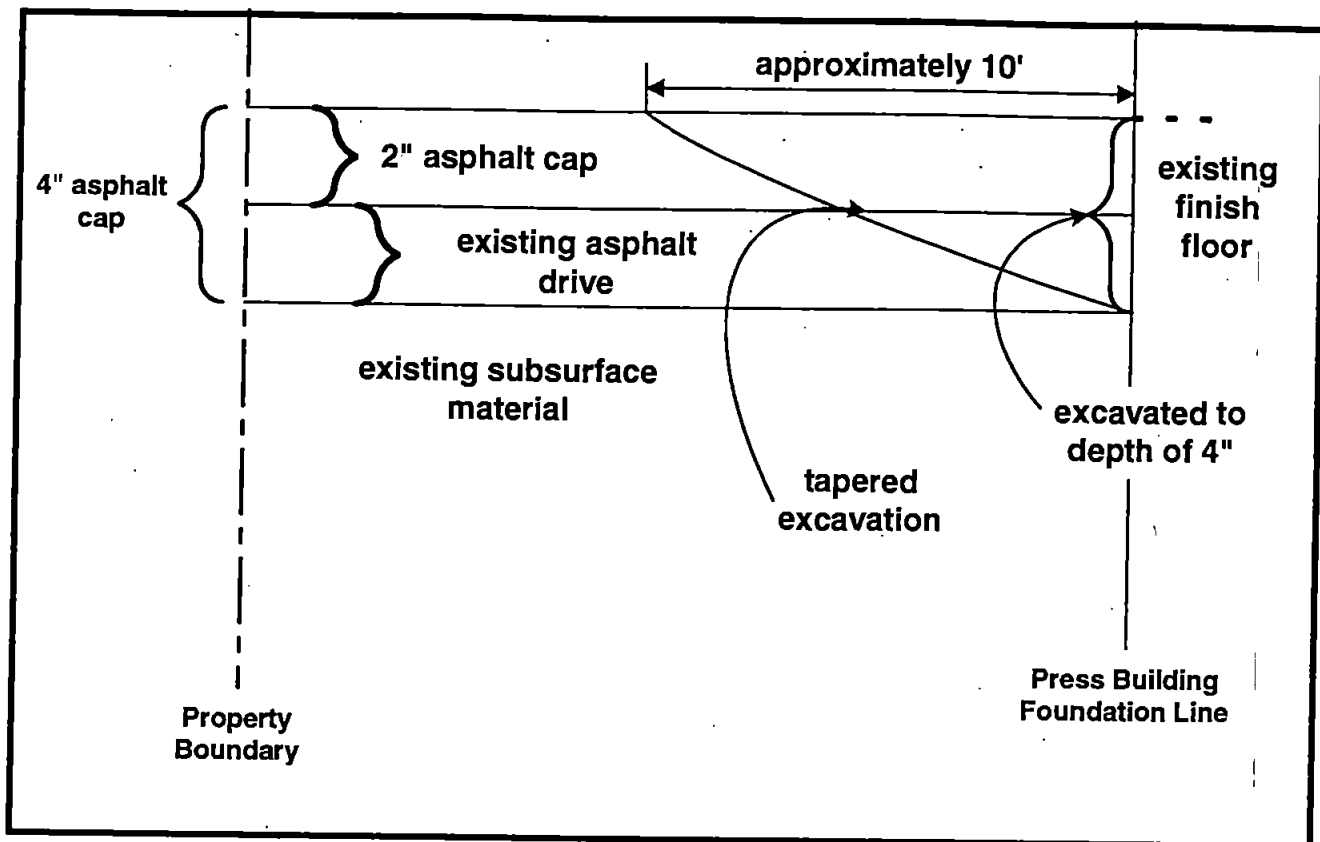

Figure 1
Cross Sectional View of Asphalt Cap Installation
The Journal American
Bellevue, Washington

Monitoring Well Number	Time	Total Depth (feet)	Depth to Water (feet)
MW-1	14:41	19.58	10.20
MW-2	14:44	13.66	6.18
MW-3	14:47	15.74	6.48
MW-4	14:50	19.52	8.53

down wind from purging and sampling activities. The pump was run at the lowest possible setting that would still produce a flow in each of the wells. MW-1 and MW-3 were purged by extracting a minimum of three well casing volumes. Field parameters for temperature and conductivity were monitored during purging. Readings were within 10 percent between the second and third casing volume removal. Therefore, it was not necessary for an additional casing volume to be purged.

Pump speed is measured in Hertz (Hz) on the Grundfos control panel. The following settings were used for purging and sampling: MW-1, 82-90 Hz; and, MW-3, 80-120 Hz. Both MW-1 and MW-3 required the pump speed to be increased as the water level dropped to overcome the hydraulic head. The flow from each well was maintained with the change in pump speed.

During the third casing volume purge at MW 3, the pump had to gradually be lowered into the well to keep it submerged. When the pump was within approximately two feet of the bottom of the well, pumping ceased and the well was allowed to recover. This occurred once during purging and once during sampling.

The Grundfos pump was decontaminated by thoroughly washing it in a solution of tap water and Liquinox detergent before and between each sampling event. The pump was allowed to circulate this washing solution for approximately 3 minutes. After washing, the pump was rinsed with distilled water and approximately 2 gallons of distilled water was pumped through the pump. The discharge hose was replaced with new hose between each well sampling to avoid possible cross contamination of the monitoring wells.

Analytical Results

Collected groundwater samples under chain-of-custody were transported and delivered to Analytical Resources, Inc., Seattle, Washington for environmental analysis. Samples were transported in a cooler containing sufficient double bagged ice to maintain an internal temperature of 4 degrees Celsius. The sample cooler was transported under chain-of-custody by CH2M HILL to Analytical Resources, Inc. on the morning of December 20, 1995. Standard CH2M HILL chain-of-custody procedures were followed at all times. Samples from monitoring wells MW-1 and MW-3 were analyzed for the parameters specified in Ecology's interim letter using the methods indicated below:

- Total Petroleum Hydrocarbon; diesel extended (WTPH-D extended)
- Total lead (EPA Method 7421)

Analytical results from the December 1995 groundwater sampling indicate no petroleum-hydrocarbon related parameter levels and no lead concentrations in excess of Model Toxic Control Act (MTCA) Method A cleanup levels for groundwater. The sampling results for Monitoring Wells MW-1 and MW-3 and a duplicate of MW-3 are summarized in Table 2 and laboratory analytical summary reports are included in Attachment A.

Table 2 Groundwater Analytical Results December 19, 1995 (micrograms per liter)		
Monitoring Well	Total Petroleum Hydrocarbon (Diesel)	Total Lead
MTCA Method A Cleanup Level	1,000	5
MW-1	ND(250)	2
MW-3	520	2
MW-3 Duplicate	530	2
Abbreviations: ND - not detected (250) - detection limit value		

Ms. Elaine P. Atkinson
Page 6
January 24, 1996
117439.IR.RP

Thus, the analytical results from the December 1995 groundwater sampling event supports the IRAR conclusions that no further action is necessary at this facility.

The next quarterly groundwater monitoring events are scheduled for February and April 1996. Results from these remaining groundwater monitoring events will be provided to you in subsequent letter submittals.

Please be advised that Ms. Adamo is heavily involved in other projects for CH2M HILL, at this time, and I will be working with Persis Corporation and the WDOE to complete the remaining IRAR groundwater monitoring work at the Journal American site. If you have any questions on the information contained in this letter report, or the attached analytical reports, please feel free to telephone me at 503/235-5022, extension 4496.

Sincerely,

CH2M HILL

**RE: Client Project: 117439.IR.RP Journal American;
ARI Project: #M639**

Dear Ms. Adamo,

Please find enclosed the original Chain of Custody record (COC) and analytical results for samples from the project referenced above. Four water samples were received in good condition on 12/20/95. There were no discrepancies between the COC and sample container labels, and they were logged into the laboratory without incident of note.

Sample analyses for total lead by EPA method 7421 and diesel and motor oil range hydrocarbons were routine. Results were faxed to you earlier today.

Laboratory Control Sample recovery results for a tph blank spike are included as QC documentation for the project.

A copy of this package, with all raw data and benchsheets, will be kept on file at ARI, should you require additional information or copies of any documentation. Please feel free to call me at any time if you find problems with these reports or have any questions.

Sincerely,

ANALYTICAL RESOURCES, INC.

Surrogate is Methyl-Arachidate.

- * ID indicates, in the opinion of the analyst, the petroleum product with the best pattern match. 'NO' indicates that there was not a good match for any of the requested products. Values reported in ppm (mg/L)
 Diesel quantitation on total peaks in the range from C12 to C24.
 Motor Oil quantitation on total peaks in the range from C24 to C32.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- E Indicates a value above the linear range of the detector. Dilution required.
- NR Indicates no recovery due to matrix interference.

3190 - 160th Avenue SE
Bellevue, WA 98008-5452

Subject: Summary of First Quarter 1996 Groundwater Sampling at The Journal American Site, Bellevue, Washington [TCP ID No. 309717]

Dear Ms. Atkinson:

This letter summarizes the analytical results from the first quarter 1996 (February 1996) groundwater compliance monitoring at The Journal American Newspaper facility, Bellevue, Washington. As you may recall, an Independent Remedial Action Report (IRAR) was submitted to the Washington Department of Ecology (Ecology) on August 17, 1995. This letter supplements that IRAR submittal.

The following sections summarize field activities conducted at the site during the first quarter of 1996.

Quarterly Groundwater Monitoring

Ecology's September 28, 1995, interim letter addresses the Independent Remedial Actions requiring additional short-term performance groundwater monitoring of four monitoring wells (MW-1, MW-2, MW-3, and MW-4) for three additional quarters (fourth quarter 1995 and first and second quarter 1996). Groundwater sampling and analysis for monitoring of monitoring wells MW-1, MW-2, MW-3, and MW-4 was to include total petroleum hydrocarbons (TPH) by analytical method WTPH-G, total petroleum hydrocarbons (TPH) by analytical method WTPH-D extended (or WTPH-D and WTPH-418.1) and total lead EPA Method 7421.

CH2M HILL conducted first quarter 1996 groundwater monitoring on February 13, 1996, as noted below.

Serving Oregon and Southwest Washington from two locations:

Portland Office	825 N.E. Multnomah, Suite 1300, Portland, OR 97232-2146	503.235.5000	503.235.2445 FAX
Corvallis Office	2300 NW Walnut Blvd., Corvallis, OR 97330-3538	503.752.4271	503.752.0276 FAX

Groundwater Sampling Protocol

Groundwater samples were collected in accordance with the Workplan developed for the groundwater monitoring program at the site. The static groundwater levels in all four monitoring wells were measured to confirm groundwater flow direction. The static groundwater levels in MW-1, MW-2, MW-3, and MW-4 were measured before initiating purging using an electronic water level indicator. The water level in these wells was measured at least twice and was repeated if the two readings did not agree to within 0.02 feet. Groundwater static water levels are presented in Table 1. Monitoring well locations and groundwater flow gradients are presented in Figure 10 of the IRAR (CH2M HILL, August 1995).

TABLE 1
Groundwater Static Levels—*The Journal American*

Monitoring Well Number	Time	Total Depth (feet)	Depth to Water (feet)
MW-1	1250	19.56	9.74
MW-2	1254	13.64	5.85
MW-3	1258	15.72	6.16
MW-4	1301	19.58	8.08

Purge volumes for monitoring wells MW-1, MW-2, MW-3, and MW-4 were calculated based on the total depth of the wells and the measured static water levels. These four monitoring wells were then purged and sampled using a Grundfos Rediflo 2 sampling pump. A Honda generator was used to power the Grundfos unit. The gasoline engine driven generator was positioned downwind from purging and sampling activities. The pump was run at the lowest possible setting that would still produce a flow in each of the wells. MW-1, MW-2, MW-3, and MW-4 were purged by extracting a minimum of three well casing volumes. Field parameters for temperature and conductivity were monitored during purging. Readings were within 10 percent between the second and third casing volume removal. Therefore, it was not necessary for an additional casing volume to be purged.

Pump speed is measured in Hertz (Hz) on the Grundfos control panel. The following settings were used for purging and sampling: MW-1, 80-143 Hz; MW-2, 64-66 Hz; MW-3, 67 Hz; and MW-4, 66-82 Hz. MW-1 and MW-4 required the pump speed to be increased as the water level dropped to overcome the hydraulic head. The flow from each well was maintained with the change in pump speed.

During the third casing volume purge at MW-1, the pump had to gradually be lowered into the well to keep it submerged. When the pump was within approximately 2 feet of the bottom of the well, pumping ceased and the well was allowed to recover. This occurred twice during purging and twice during sampling.

The Grundfos pump was decontaminated by thoroughly washing it in a solution of tap water and Liquinox detergent before and between each sampling event. The pump was allowed to circulate this washing solution for approximately 3 minutes. After washing, the pump was rinsed with distilled water and approximately 2 gallons of distilled water was pumped through the pump. The discharge hose was replaced with new hose between each well sampling to avoid possible cross-contamination of the monitoring wells.

Analytical Results

Collected groundwater samples under chain-of-custody were transported and delivered to Analytical Resources, Inc., Seattle, Washington, for environmental analysis. Samples were transported in a cooler containing sufficient double bagged ice to maintain an internal temperature of 4°C. The sample cooler was transported under chain-of-custody by CH2M HILL to Analytical Resources, Inc., on the morning of February 14, 1996. Standard CH2M HILL chain-of-custody procedures were followed at all times. Samples from monitoring wells MW-1, MW-2, MW-3, and MW-4 were analyzed for the parameters specified in Ecology's interim letter using the methods indicated below.

- TPH, (WTPH-G)
- TPH, diesel-extended (WTPH-D extended)
- Total lead (EPA Method 7421)

Analytical results from the February 1996 groundwater sampling indicate no petroleum hydrocarbon-related parameter levels and no lead concentrations in excess of Model Toxic Control Act (MTCA) Method A cleanup levels for groundwater. The sampling results for Monitoring Wells MW-1, MW-2, MW-3, and MW-4 and a duplicate of MW-3 are summarized in Table 2 and laboratory analytical summary reports are included in Attachment A.

TABLE 2
Groundwater Analytical Results, February 13, 1996 (micrograms per liter)

Monitoring Well	Total Petroleum Hydrocarbon (diesel)	Total Petroleum Hydrocarbon (gasoline)	Total Lead
MTCA Method A Cleanup Level	1,000	1,000	5
MW-1	250 U	250 U	3
MW-2	250 U	250 U	1 U
MW-3	580	540	1
MW-4	250 U	250 U	1 U
MW-3 Duplicate	570	570	2

Abbreviations:

U = Compound not detected at given detection limit

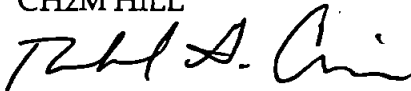

The analytical results from the February 1996 groundwater sampling event supports the IRAR conclusions that no further action is necessary at this facility.

The next quarterly groundwater monitoring event occurred on May 14, 1996. Results from this remaining groundwater monitoring event will be provided to you next week.

If you have any questions on the information contained in this letter report, or the attached analytical reports, please feel free to telephone me at 503/235-5022, extension 4496.

Sincerely,

CH2M HILL

Analytical Resources, Incorporated
Analytical Chemists and Consultants

26 February 1996

Dick Crimm
CH2M Hill
825 NE Multnomah, Suite 1300
Portland, OR 97232

**RE: Client Project: 117439.IR.RP Journal American;
ARI Project: #N081**

Dear Mr. Crimm,

Please find enclosed the original Chain of Custody records (COC) and analytical results for samples from the project referenced above. Five water samples, an equipment blank, and a trip blank were received in good condition on 2/14/96. There were no discrepancies between the COCs and sample container labels, and they were logged into the laboratory without incident of note.

Sample analyses for gasoline and diesel range hydrocarbons by the WTPH methods, total lead by EPA method 7421, and BETX by method 8020 (on the trip blank only) were routine. Results were faxed to you and to Glen Vedera as soon as they became available. As noted when the results were faxed, hydrocarbon patterns in samples **JA-MW3** and **JA-MW5** appear to match those of the diesel standard used for quantitation. Parts of the patterns extend into the gasoline range, however they are not positively IDed as gasoline. There could be some weathered gas, or gas mixed with the diesel. Chromatograms are included to assist with your evaluation of the results.

Sample **JA-MW2** was used as the QC sample for lead and tph-G, and sample **JA-MW1** was used for tph-D; matrix spike/duplicate results are included as documentation. Laboratory Control Sample recovery results for all three parameters are included as additional QC documentation for the project.

A copy of this package, with all raw data and benchsheets, will be kept on file at ARI, should you require additional information or copies of any documentation. Please feel free to call me at any time if you find problems with these reports or have any questions.

Sincerely,
ANALYTICAL RESOURCES, INC.

Surrogate A is Trifluorotoluene.

Surrogate B is Bromobenzene.

Values reported in ppm (mg/L).

Quantitation on total peaks in the gasoline range from Toluene to C12.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- NR Indicates no recovery due to matrix interference.

Subject: Summary of Second Quarter 1996 and Short Term Performances Groundwater Sampling at The Journal American Site, Bellevue, Washington [TCP ID No. 309717]

Dear Ms. Atkinson:

This letter summarizes the analytical results from the second quarter 1996 (May 1996) groundwater compliance monitoring at The Journal American Newspaper facility, Bellevue, Washington. As you may recall, an Independent Remedial Action Report (IRAR) was submitted to the Washington Department of Ecology (Ecology) on August 17, 1995. This letter supplements that IRAR submittal.

The following sections summarize field activities conducted at the site during the second quarter of 1996.

Quarterly Groundwater Monitoring

Ecology's September 28, 1995, interim letter addresses the Independent Remedial Actions requiring additional short-term performance groundwater monitoring of four monitoring wells (MW-1, MW-2, MW-3, and MW-4) for three additional quarters (fourth quarter 1995 and first and second quarter 1996). Groundwater sampling and analysis for monitoring of monitoring wells MW-1, MW-2, MW-3, and MW-4 was to include total petroleum hydrocarbons (TPH) by analytical method WTPH-G, total petroleum hydrocarbons (TPH) by analytical method WTPH-D extended (or WTPH-D and WTPH-418.1) and total lead EPA Method 7421.

CH2M HILL conducted second quarter 1996 groundwater monitoring on May 14, 1996, as noted below.

Serving Oregon and Southwest Washington from two locations:

Portland Office	825 N.E. Mulnomah, Suite 1300, Portland, OR 97232-2146	503.235.5000	503.235.2445 FAX
Corvallis Office	2300 NW Walnut Blvd., Corvallis, OR 97330-3538	503.752.4271	503.752.0276 FAX

Groundwater Sampling Protocol

Groundwater samples were collected in accordance with the Workplan developed for the groundwater monitoring program at the site. The static groundwater levels in all four monitoring wells were measured to confirm groundwater flow direction. The static groundwater levels in MW-1, MW-2, MW-3, and MW-4 were measured before initiating purging using an electronic water level indicator. The water level in these wells was measured at least twice and was repeated if the two readings did not agree to within 0.02 feet. Groundwater static water levels are presented in Table 1. Monitoring well locations and groundwater flow gradients are presented in Figure 10 of the IRAR (CH2M HILL, August 1995).

TABLE 1
Groundwater Static Levels—*The Journal American*

Monitoring Well Number	Time	Total Depth (feet)	Depth to Water (feet)
MW-1	1210	19.52	10.12
MW-2	1340	13.60	6.35
MW-3	1300	15.69	6.51
MW-4	1400	19.25	8.37

Purge volumes for monitoring wells MW-1, MW-2, MW-3, and MW-4 were calculated based on the total depth of the wells and the measured static water levels. These four monitoring wells were then purged and sampled using a Grundfos Rediflo 2 sampling pump. A Honda generator was used to power the Grundfos unit. The gasoline engine driven generator was positioned downwind from purging and sampling activities. The pump was run at the lowest possible setting that would still produce a flow in each of the wells. MW-1, MW-2, MW-3, and MW-4 were purged by extracting a minimum of three well casing volumes. Field parameters for temperature and conductivity were monitored during purging. Readings were within 10 percent between the second and third casing volume removed. Therefore, it was not necessary for an additional casing volume to be purged. The initial water removed from MW-4 was a turbid orange (presumably from iron oxide).

Pump speed is measured in Hertz (Hz) on the Grundfos control panel. The following settings were used for purging and sampling: MW-1, 85 Hz; MW-2, 78 Hz; MW-3, 78 Hz; and MW-4, 80 Hz. The flow from each well was maintained with the change in pump speed.

The Grundfos pump was decontaminated by thoroughly washing it in a solution of tap water and Liquinox detergent before and between each sampling event. The pump was allowed to circulate this washing solution for approximately 3 minutes. After washing, the pump was rinsed with distilled water, sprayed with a 10% nitric acid solution then rinsed with distilled water. The discharge hose was replaced with new hose between each well sampling to avoid possible cross-contamination of the monitoring wells.

Analytical Results

Collected groundwater samples under chain-of-custody were transported and delivered to Analytical Resources, Inc., Seattle, Washington, for environmental analysis. Samples were transported in a cooler containing sufficient double bagged ice to maintain an internal temperature of 4°C. The sample cooler was transported under chain-of-custody by CH2M HILL to Analytical Resources, Inc., on the morning of May 15, 1996. Standard CH2M HILL chain-of-custody procedures were followed at all times. Samples from monitoring wells MW-1,

MW-2, MW-3, and MW-4 were analyzed for the parameters specified in Ecology's interim letter using the methods indicated below.

- TPH, (WTPH-G)
- TPH, diesel-extended (WTPH-D extended)
- Total lead (EPA Method 7421)

Analytical results from the February 1996 groundwater sampling indicate no petroleum hydrocarbon-related parameter levels and no lead concentrations in excess of Model Toxic Control Act (MTCA) Method A cleanup levels for groundwater. The sampling results for Monitoring Wells MW-1, MW-2, MW-3, and MW-4 and a duplicate of MW-3 are summarized in Table 2 and laboratory analytical summary reports are included in Attachment A.

TABLE 2
Groundwater Analytical Results, May 14, 1996 (micrograms per liter)

Monitoring Well	Total Petroleum Hydrocarbon (diesel)	Total Petroleum Hydrocarbon (gasoline)	Total Lead
MTCA Method A Cleanup Level	1,000	1,000	5
MW-1	250 U	250 U	2
MW-2	250 U	250 U	2
MW-3	620	550	1 U
MW-4	250 U	250 U	1
MW-3 Duplicate	610	510	1

Abbreviations:

U = Compound not detected at given detection limit

The analytical results from the May 1996 groundwater sampling event supports the IRAR conclusions that no further action is necessary at this facility.

SUMMARY OF SHORT TERM PERFORMANCE MONITORING ACTIVITIES

Since receipt of Ecology's September 28, 1995 correspondence, CH2M HILL has completed the verification activities set forth therein as the Short Term Performance Monitoring work. The results of those activities are summarized as follows:

- The groundwater monitoring data as summarized in the attached Table. These results demonstrate that in ten (10) sampling events over a twenty (20) month period, none of the monitored constituents (including: Gasoline, Diesel, Benzene, Toluene, Ethyl Benzene, Xylenes, and lead) approach or exceed MTCA Method A cleanup levels for groundwater.
- As reported in our January 24, 1996 letter report, on October 30, 1995, Totem Paving installed a four (4) inch asphalt cap in the area directly south of the Press Building, and the cap serves as an effective containment measure for the residual TPH constituents in the soil.

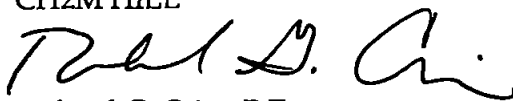

- Attached is a final draft of the Restrictive Covenant and Exhibit A -Legal Description of 1705 132nd Ave., Bellevue, Washington. This document will be recorded with King County upon Ecology's notifying us that the wording of the document is acceptable to Ecology. A copy of the recorded document will then be forwarded to Ecology.

As noted in our August 1995 IRAP report, the majority of the remaining petroleum hydrocarbon contaminated soil (approximately 430 cubic yards) associated with the south underground storage tank at The Journal American is located beneath the press building. Additional soil removal is not possible at this time because of potential impacts to the structural integrity of the press building and the operational constraints associated with publishing and distributing The Journal American newspaper. Given that the source of the contamination (i.e., the underground storage tank) was removed some time prior to construction of the press building in 1983; that source area is capped by the press building, that the surrounding area is covered with a 4" asphalt cap; and that groundwater contamination for any constituent is not present above MTCA Method A cleanup levels after 13 years of presence in the soil, the cap has demonstrated its effectiveness as an effective containment measure. Accordingly, a No Further Action should be issued by Ecology for this site.

If you have any questions on the information contained in this letter report, or the attached analytical reports, please feel free to telephone me at 503/235-5022, extension 4496.

Sincerely,

CH2M HILL

THE SOUTH 205 FEET OF THE SOUTH HALF OF THE SOUTHEAST QUARTER OF THE SOUTHEAST QUARTER OF THE NORTHEAST QUARTER OF SECTION 28, TOWNSHIP 25 NORTH, RANGE 5 EAST, WILLAMETTE MERIDIAN, IN KING COUNTY, WASHINGTON;

EXCEPT THAT PORTION LYING WESTERLY ON THE FOLOWING DECRIBED LINE:

BEGINNING AT A POINT ON THE SOUTH LINE OF SAID SUBDIVISION WHICH IS SOUTH 88°21'04" EAST 280 FEET FROM THE SOUTHWEST CORNER OF SAID SUBDIVISION; THENCE NORTHERLY PARALLEL WITH THE WEST LINE OF SAID SUBDIVISION 205 FEET, MORE OR LESS, TO THE NORTH LINE OF SAID SOUTH 205 FEET;

EXCEPT THE EAST 30 FEET THEREOF CONVEYED TO THE CITY OF BELLEVUE FOR ROAD PURPOSES BY DEED UNDER RECORDING NUMBER 7109100202.

RESTRICTIVE COVENANT

Notice is hereby given that the property described on Exhibit A attached hereto and known as, the press building of The Journal American newspaper property, located at 1705 132nd Avenue, Bellevue, Washington, 98005, has been the subject of an Independent Remedial Action conducted under Wash. Rev. Code Section 70.105D (1993). Certain of the on-site soils are contaminated with petroleum hydrocarbons and are capped by the press building and its parking lot area, as depicted Figures 5 through 9 of the **INDEPENDENT REMEDIAL ACTION REPORT: The Journal American Facility, Bellevue, Washington**, prepared by CH2M HILL, dated August 1995 and submitted to the Washington Department of Ecology's (WDOE), Northwest Region, Bellevue, Washington. The maximum residual soil concentration of total petroleum hydrocarbon (TPH) gasoline is 1,200 milligrams per kilogram (mg/kg) at boring locations B04 at the 10 foot depth and B10 at the 7.5 foot depth. The maximum residual concentration of TPH diesel is 12,000 mg/kg at B04 at the 10 foot depth. These maximum soils concentrations exceed the Washington State Models Toxics Control Act (MTCA) Level A cleanup standards of 100 mg/kg gasoline in soil and 200 mg/kg diesel in soil. Until such time as this covenant is removed according to its terms, use of this property is restricted in accordance with Wash. Admin. Code 173-340-440, which is incorporated here by reference, as follows:

- a) No activities may be conducted at the property that may interfere with the groundwater monitoring and the continued protection of the Independent Remedial Action;
- b) No activities may be conducted that may result in the release the petroleum hydrocarbon contamination capped by the press building, loading dock and asphalt paving identified as capping the petroleum hydrocarbon contamination in Figures 6 through 9 above;
- c) Written notification must be given to the WDOE or its successor agency before excavating, moving or removing the soils or material beneath the press building, loading dock, and asphalt paving which are capped by these structures;
- d) Written notification must be given to WDOE or its successor agency before removal or destruction of the existing press building, loading dock, or asphalt paving identified as capping the petroleum hydrocarbon contamination in Exhibit B;
- e) Written notification must be given to the WDOE or its successor agency of owner's intent to convey any interest in the property. Further, no conveyance of title, easement, lease, or other interest in the property will be consummated by the owner of the property without notice of this covenant;
- f) Any use of the property in a manner inconsistent with this restrictive covenant must have the prior approval of the WDOE or its successor agency;
- g) The WDOE or successor agency or its designated representative shall have the right to enter the property after reasonable prior notice, at reasonable times for the purpose of evaluating compliance with the terms of this restrictive covenant, to take samples and to inspect records related to the Independent Remedial Action;

- h) Upon remediation (by removal or otherwise) of the petroleum contaminated soil to below those levels set forth in Wash. Admin. Code 173-340-700 through 173-340-760, the owner may record an instrument stating that this restrictive covenant is of no further force or effect, provided the owner has the consent of the WDOE or its successor agency to so do.

Dated this ____ day of February, 1996.

Subject: Summary of Third (Final) Quarter 1996 Groundwater Sampling at The Journal American Site, Bellevue, Washington [TCP ID No. 309717]

Dear Ms. Atkinson:

This letter summarizes the analytical results from the third quarter 1996 (August 1996) groundwater monitoring at The Journal American Newspaper facility, Bellevue, Washington. An Independent Remedial Action Report (IRAR) was submitted to the Washington Department of Ecology (Ecology) on August 17, 1995. This letter supplements that IRAR submittal and our discussion on August 29, 1996.

As agreed during that discussion, this report represents the final monitoring episode at The Journal American prior to the issuance of the No Further Action letter from Ecology.

All monitoring wells were abandoned on September 16, 1996 by Cascade Drilling. As described in this letter, the abandonment work included casing removal, overdrilling the borehole, followed by placement of a grout seal and restoration of the surface paving.

Quarterly Groundwater Monitoring

In accordance with Ecology's September 28, 1995 interim letter, Persis Corporation completed short-term performance groundwater monitoring of four monitoring wells (MW-1, MW-2, MW-3, and MW-4) for three additional quarters (fourth quarter 1995 and first and second quarters of 1996). Previous groundwater sampling and analysis of monitoring wells MW-1, MW-2, MW-3, and MW-4 included total petroleum hydrocarbons (TPH) by analytical method WTPH-G, total petroleum hydrocarbons (TPH) by analytical method WTPH-D extended (or WTPH-D and WTPH-418.1) and total lead EPA Method 7421. Results from the first and second quarter 1996 monitoring indicated a minor exceedance of the MTCA Method A concentration limit of 1 mg/L for TPH at MW-3.

RECEIVED

SEP 23 1996

V. _____

CH2M HILL performed third quarter 1996 groundwater monitoring at two wells (MW-1 and MW-3) on August 22, 1996, as noted below. Monitoring wells MW-2 and MW-4 were not sampled based on their past monitoring record.

Groundwater Sampling Protocol

Groundwater samples were collected in accordance with the Workplan developed for the groundwater monitoring program at the site. The static groundwater levels in all four monitoring wells were measured to confirm groundwater flow direction. The static groundwater levels in MW-1, MW-2, MW-3, and MW-4 were measured before initiating purging using an electronic water level indicator. The water level in these wells was measured at least twice and was repeated if the two readings did not agree to within 0.02 feet. Groundwater static water levels are presented in Table 1. Monitoring well locations and groundwater flow gradients are presented in Figure 10 of the IRAR (CH2M HILL, August 1995).

TABLE 1
August 22, 1996 Groundwater Static Levels
The Journal American

Monitoring Well Number	Time	Depth to Water (feet)	Water Level Elevation ¹ (feet)
MW-1	1105	11.30	88.22
MW-2	1108	7.83	92.55
MW-3	1110	7.98	92.41
MW-4	1112	9.57	90.87

¹Water level elevations are based on an arbitrary site datum of 100 feet.

Purge volumes for monitoring wells MW-1 and MW-3 were calculated based on well total depth and measured water levels. The two monitoring wells were purged and sampled using a Grundfos Rediflo 2 sampling pump. A Honda generator was used to power the Grundfos unit. The gasoline engine driven generator was positioned downwind from purging and sampling activities. The pump was run at the lowest possible setting that still produced flow in each of the wells. Wells were purged a minimum of three casing volumes. The field parameters temperature, pH, and conductivity were within 10% between the second and third casing volume, therefore it was not necessary for an additional casing volume to be purged from either well.

Pump speed is measured in Hz on the Grundfos control panel. The following settings were used for purging and sampling: MW-1, 87 Hz maximum; MW-3, 80 Hz maximum. MW-1 and MW 3 required an increasing pump speed as the water level dropped to overcome the hydraulic head.

During sampling at MW 3 the pump had to gradually be lowered in order to keep it submerged. When the pump was within approximately two feet of the bottom, pumping ceased and the well was allowed to recover.

The Grundfos pump was decontaminated by thoroughly washing in a solution of tap water and Liquinox detergent. The pump circulated this solution for approximately 5 minutes. After washing the pump was submerged in tap water and allowed to pump for approximately 5 minutes. The pump was then sprayed with a 10% nitric acid solution

followed by a thorough rinse with 1 gallon of distilled water. HDPE discharge tubing was replaced with new tubing between each well.

A field duplicate sample was obtained at well MW-3. The duplicate sample was designated JA-MW-5 and was given a sample time of 1400.

An equipment blank sample was obtained after MW-1 and MW-3 were sampled. The pump was decontaminated as described above. Then ASTM Type II water was poured over and pumped through the pump. The rinsate was collected into appropriate sample containers. The equipment blank sample was designated JA-EB with a sample time of 1430.

The ASTM Type II water was produced by RICCA, catalog number 9150-1, lot number E-171.

Analytical Results

Samples were transported in a cooler containing sufficient double bagged ice to maintain an internal temperature of 4°C. The sample cooler was transported under chain-of-custody by CH2M HILL to Analytical Resources, Inc., Seattle, Washington on August 22, 1996.

Standard CH2M HILL chain-of-custody procedures were followed at all times. Samples from monitoring wells MW-1 and MW-3 were analyzed using the following methods:

- TPH, (WTPH-G)
- TPH, diesel-extended (WTPH-D extended)
- Total lead (EPA Method 7421)
- Volatile Organic Compounds (VOCs, EPA Method 8260)
- Polynuclear Aromatic Hydrocarbons (PAH, EPA Method 8270-SIM)

Analytical results from the August 1996 groundwater sampling indicate no petroleum hydrocarbon-related parameter levels and no lead concentrations in excess of Model Toxic Control Act (MTCA) Method A cleanup levels for groundwater. The "basic" (TPH-G, TPH-D, and lead) analytical results for monitoring wells MW-1 and MW-3 and a duplicate of MW-3 are summarized in Table 2.

TABLE 2
Groundwater Analytical Results, August 22, 1996 (micrograms per liter, µg/L)
The Journal American

Monitoring Well	Total Petroleum Hydrocarbon (diesel)	Total Petroleum Hydrocarbon (gasoline)	Total Lead
MTCA Method A Cleanup Level	1,000 ¹	1,000 ¹	5
MW-1	250 U	250 U	2
MW-3	580	400	1 U
MW-3 Duplicate	490	400	2

¹Cleanup level of 1,000 µg/L is based on the sum of TPH-D and TPH-G.
 U = Compound not detected at given detection limit

Because the MTCA Method A cleanup level for TPH is based on qualitative taste and odor considerations, CH2M HILL also completed analysis for the following other MTCA Method A risk or standard-based constituents:

- Principal gasoline constituents: benzene, toluene, ethyl benzene, xylene (BTEX),
- Gasoline additives: 1,2-dichloroethane and ethylene dibromide, and
- Diesel carcinogenic PAHs: benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, pyrene, and indeno(1,2,3-c,d)pyrene.

The results of this analysis for MW-3 is presented in Table 3. The additional constituents noted above were not detected in the sample from MW-1, the downgradient well near the south property boundary. Complete laboratory analytical summary reports are included in Attachment A.

TABLE 3
Summary of Groundwater Monitoring Program at MW-3
The Journal American
 (All units in µg/L)

Constituent	Cleanup Criteria/Standard	MW-3 Monitoring Results	
	MTCA Method A	August 1996 (average)	Previous Maximum
Total Petroleum Hydrocarbons	1,000	935	1,170
Gasoline Hydrocarbons			
Benzene	5	0.85	1.2
Ethyl Benzene	30	5.3	7.8
Toluene	40	0.4	<1.0
Xylenes	20	12.7	20.3
Gasoline Additives			
1,2-Dichloroethane	5	<0.2	--
Ethylene Dibromide	0.01	<0.2	--
Lead	5	1.5	5
Diesel Hydrocarbons			
<i>Total Carcinogenic PAHs</i>	0.1	<0.1*	--
Benzo(a)anthracene	--	<0.1	--
Benzo(b)fluoranthene	--	<0.1	--
Benzo(k)fluoranthene	--	<0.1	--
Benzo(a)pyrene	--	<0.1	--
Chrysene	--	<0.1	--
Dibenzo(a,h)anthracene	--	<0.1	--
Indeno(1,2,3-c,d)pyrene	--	<0.1	--
Pyrene	--	<0.1	--

Notes:

August 1996 results are the average constituent concentrations between primary sample and blind duplicate from MW-3.

*Total carcinogenic PAH value computed by summing individual constituents.

As agreed to during our August 29, 1996 discussion, the analytical results from the August 1996 groundwater sampling event supports the IRAR conclusions that no further action is necessary at this facility.

Well Abandonment Procedures

CH2M HILL contracted Cascade Drilling Inc. of Woodinville WA (Cascade) to perform the well abandonments at the Journal American site. Well abandonment was completed on September 16, 1996. Cascade was the drilling contractor that installed the wells and was familiar with the well construction and the Journal American site.

All four monitoring wells were abandoned by the following steps:

- Jackhammer out the flush monuments and surrounding concrete;
- Overdrill the borehole using a CME 55 hollow-stem-auger drilling rig (includes drilling out the PVC casing, bentonite seals and sand pack);
- Drum the cuttings generated from the overdrilling activities;
- Install hydrated bentonite chips to within three feet of land surface (chips were hydrated with potable water at a minimum, every five feet and at the top of the seal); and
- Install a three-foot thick concrete seal (dyed black to match the asphalt) as the surface completion

Construction and abandonment information for the four monitoring wells at the Journal American site is provided in Table 4 below. Cascade Drilling has sent the abandonment reports to Ecology as required under WAC 173-160-560.

TABLE 4
Well Construction and Abandonment Information
The Journal American

Monitoring Well Number	Depth to Water ¹ (ft.)	Total Well Depth (ft.)	Overdrilled Depth (ft.)	Backfill Material
MW-1	11.30	19.52	20	hydrated bentonite chips, concrete
MW-2	7.83	13.60	15	hydrated bentonite chips, concrete
MW-3	7.98	15.69	20	hydrated bentonite chips, concrete
MW-4	9.57	19.25	20	hydrated bentonite chips, concrete

¹Depth to water data from the August 22, 1996 sampling event

Conclusions

As noted in our August 1995 IRAP report, the majority of the remaining petroleum hydrocarbon contaminated soil (approximately 430 cubic yards) associated with the former south underground storage tank at The Journal American is located beneath the press building. Additional soil removal is not possible because of potential impacts to the structural integrity of the press building and the operational constraints associated with publishing and distributing The Journal American newspaper. Given that the source of the contamination (i.e., the underground storage tank) was removed some time prior to construction of the press building in 1983; that source area is capped by the press building,

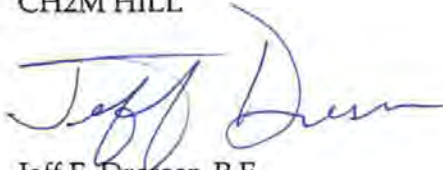

that the surrounding area is covered with a 4" asphalt cap; and that groundwater contamination for any constituent is not present above MTCA Method A cleanup levels after 13 years of presence in the soil, the cap has demonstrated its effectiveness as an effective containment measure. Accordingly, a No Further Action determination should be issued by Ecology for this site.

As discussed on August 29, 1996, the Restrictive Covenant that will be recorded in the property's deed has been separately communicated to you through Persis' outside counsel on this matter.

If you have any questions on the information contained in this letter report, or the attached analytical reports, please feel free to telephone me at 503/235-5022, extension 4467.

Sincerely,

CH2M HILL

**RE: Client Project: 117439.IR.RP Journal American;
ARI Project: #P886**

Dear Mr. Dresser,

Please find enclosed the original Chain of Custody record (COC) and analytical results for samples from the project referenced above. Three water samples, an equipment blank, and a trip blank were received in good condition on 8/22/96. There were no discrepancies between the COC and sample container labels, and they were logged into the laboratory without incident of note.

Sample analyses for lead, diesel and gasoline range hydrocarbons, and volatile organics were routine, and the results were faxed to you as soon as they became available. The hydrocarbon patterns in samples **JA-MW-3** and **JA-MW-5** do appear to match the diesel standard used for quantitation. Chromatograms are included to assist with your evaluation of the results.

Samples were analyzed for PAH compounds by the SIM method in order to achieve low detection limits. Preliminary results were faxed to you, and at that time it was noted that two of the samples had high surrogate recoveries. These samples were reanalyzed after instrument maintenance was performed, and the surrogate recoveries came within limits. Both sets of results are reported, and they are not significantly different from one another.

Sample **JA-MW-1** was used as a QC sample for gasoline-range hydrocarbons; a matrix spike/matrix spike duplicate report is included as documentation. Laboratory Control Sample recovery results for all parameters are included as additional QC documentation for the project.

A copy of this package, with all raw data and benchsheets, will be kept on file at ARI, should you require additional information or copies of any documentation. Please feel free to call me at any time if you find problems with these reports or have any questions.

Sincerely,
ANALYTICAL RESOURCES, INC.

Surrogate is Methyl-Arachidate.

- * ID indicates, in the opinion of the analyst, the petroleum product with the best pattern match. 'NO' indicates that there was not a good match for any of the requested products. Values reported in ppm (mg/L)
Diesel quantitation on total peaks in the range from C12 to C24.
Motor Oil quantitation on total peaks in the range from C24 to C38.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- E Indicates a value above the linear range of the detector. Dilution required.
- NR Indicates no recovery due to matrix interference.

Surrogate A is Trifluorotoluene.

Surrogate B is Bromobenzene.

Values reported in ppm (mg/L).

Quantitation on total peaks in the gasoline range from Toluene to C12.

Data Qualifiers

- U Compound not detected at the given detection limit.
- X Value detected above linear range of instrument. Dilution required.
- J Indicates an estimated value below the calculated detection limit.
- S No value reported due to saturation of the detector. Dilution required.
- D Indicates the surrogate was not detected because of dilution of the extract.
- NR Indicates no recovery due to matrix interference.

Ecology Records (Restrictive Covenant & Periodic Review)

RESTRICTIVE COVENANT

Notice is hereby given that the property described on Exhibit "A" attached hereto and known as, the press building of The Journal American newspaper property, located at 1705 132nd Avenue, Bellevue, Washington, 98005, has been the subject of an Independent Remedial Action conducted under Wash. Rev. Code Section 70.105D (1993). Certain of the on-site soils are contaminated with petroleum hydrocarbons and are capped by the press building and its parking lot area, as depicted by Figures 6 through 9 of the INDEPENDENT REMEDIAL ACTION REPORT: The Journal American Facility, Bellevue, Washington (the "Report"), prepared by CH2M HILL, dated August 1995 and submitted to the Washington Department of Ecology's (WDOE), Northwest Region, Bellevue Washington. At the time of the Report, the maximum residual soil concentration of total petroleum hydrocarbon (TPH) gasoline was 1,200 milligrams per kilogram (mg/kg) at boring locations B04 at the 10 foot depth and B10 at the 7.5 foot depth and the maximum residual concentration of TPH diesel was 12,000 mg/kg at B04 at the 10 foot depth. These maximum soils concentrations exceed the Washington State Models Toxics Control Act (MTCA) Level A cleanup standards of 100 mg/kg gasoline in soil and 200 mg/kg diesel in soil. Until such time as this covenant is removed according to its terms, use of this property is restricted in accordance with Wash. Admin. Code (WAC) 173-340-440, which is incorporated here by reference, as follows:

9609271199

- a) No activities may be conducted at the property that may interfere with the groundwater monitoring and the continued protection of the Independent Remedial Action;
- b) No activities may be conducted that may result in the release of the petroleum hydrocarbon contamination capped by the press building, loading dock and asphalt paving identified as capping the petroleum hydrocarbon contamination in Figures 6 through 9 above;
- c) Water well(s) shall not be installed on the property for purpose of domestic water use;
- d) Written notification must be given to the WDOE or its successor agency before excavating, moving or removing the soils or material beneath the press building, loading dock, and asphalt paving which are capped by these structures. In the event the cement flooring and foundation of the press building or the loading dock are demolished, all TPH contaminated soils above applicable WAC 173-340-700 through 173-340-760 cleanup standards shall be removed and disposed of in accordance with applicable law or, in the alternative, appropriate sampling and testing shall be completed that documents that the remaining TPH contaminated soils are below applicable cleanup criteria. A report documenting

960927-1199 01:48:00 PM KING COUNTY RECORDS 005 SH 12.00

these facts shall be submitted to WDOE or its successor agency for review and approval.

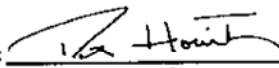

- e) Written notification must be given to WDOE or its successor agency before removal or destruction of those areas of the existing press building, loading dock, or asphalt paving identified as capping the petroleum hydrocarbon contamination in Exhibit "B";
- f) Written notification must be given to the WDOE or its successor agency of owner's intent to convey any interest in the property. Further, no conveyance of title, easement, lease, or other interest in the property will be consummated by the owner of the property without notice of this Restrictive Covenant;
- g) The owner must notify WDOE or its successor agency, prior to any use of the property that is inconsistent with the terms of this Restrictive Covenant.
- h) The WDOE or successor agency or its designated representative shall have the right to enter the property after 24-hour prior notice, at reasonable times for the purpose of evaluating compliance with the terms of this Restrictive Covenant, to take samples and to inspect records related to the Independent Remedial Action;
- i) Upon remediation (by removal or otherwise) of the petroleum contaminated soil to below those levels set forth in Wash. Admin. Code 173-340-700 through 173-340-760, the owner may record an instrument stating that this restrictive covenant is of no further force or effect, provided the owner has the consent of the WDOE or its successor agency to so do.

9609271199

IN WITNESS WHEREOF, the undersigned has executed this instrument as of the 25 day of September, 1996.

RECITALS

- A. Northwest Media (Washington), L.P., an Ohio limited partnership ("NMW") owns that certain real property commonly known as 1705 132nd Avenue, Bellevue, King County, Washington ("Parcel A").
- B. O.B. Bellevue Properties, LLC, a Washington limited liability company ("OB"), as successor in interest to OB Bellevue Properties II, LLC, owns that certain real property immediately adjacent to Parcel A, commonly known as 1625 132nd Avenue NE, Bellevue, Washington ("Parcel B"). Parcel A and Parcel B are legally described on Exhibit A attached hereto.
- C. NMW is the previous owner of Parcel B. NMW conveyed Parcel B to OB on or about April 1, 2003 under that certain Special Warranty Deed recorded on April 1, 2003 as Auditor's File No. 20030401002879, King County, Washington.
- D. Parcel A and Parcel B are encumbered by that certain Restrictive Covenant, dated September 25, 1996 and recorded under Auditor's File No. 9609271199, King County, Washington (the "Restrictive Covenant"). The Restrictive Covenant sets forth certain use restrictions for property identified as "the press building of the Journal American Newspaper property" as a result of soil contamination. The map attached to the Restrictive Covenant indicates that the contaminated soil is located on Parcel B only. The map does not indicate any contamination on Parcel A.
- E. NMW and OB requested a letter from the Washington State Department of Ecology ("DOE") consenting to the release of the Restrictive Covenant from Parcel A. DOE provided NMW and OB with a letter dated April 26, 2005 (the "Consent") that acknowledges that the Restrictive Covenant was erroneously recorded against Parcel A and consenting to the release of Parcel A from the Restrictive Covenant. A copy of the Consent is attached hereto as Exhibit B.

RELEASE

- 1. NMW and OB hereby release the Restrictive Covenant on Parcel A.
- 2. OB acknowledges and agrees that the Restrictive Covenant still encumbers Parcel B and remains in full force and effect, unmodified and unchanged by this Release of Restrictive Covenant.
- 3. This instrument may be executed in any number of counterparts, each of which, when executed and delivered, will be deemed to be an original, and all of which taken together will be deemed to be but one and the same instrument.

RESTRICTIVE COVENANT

Notice is hereby given that the property described on Exhibit "A" attached hereto and known as, the press building of The Journal American newspaper property, located at 1705 132nd Avenue, Bellevue, Washington, 98005, has been the subject of an Independent Remedial Action conducted under Wash. Rev. Code Section 70.105D (1993). Certain of the on-site soils are contaminated with petroleum hydrocarbons and are capped by the press building and its parking lot area, as depicted by Figures 6 through 9 of the INDEPENDENT REMEDIAL ACTION REPORT: The Journal American Facility, Bellevue, Washington (the "Report"), prepared by CH2M HILL, dated August 1995 and submitted to the Washington Department of Ecology's (WDOE), Northwest Region, Bellevue Washington. At the time of the Report, the maximum residual soil concentration of total petroleum hydrocarbon (TPH) gasoline was 1,200 milligrams per kilogram (mg/kg) at boring locations B04 at the 10 foot depth and B10 at the 7.5 foot depth and the maximum residual concentration of TPH diesel was 12,000 mg/kg at B04 at the 10 foot depth. These maximum soils concentrations exceed the Washington State Models Toxics Control Act (MTCA) Level A cleanup standards of 100 mg/kg gasoline in soil and 200 mg/kg diesel in soil. Until such time as this covenant is removed according to its terms, use of this property is restricted in accordance with Wash. Admin. Code (WAC) 173-340-440, which is incorporated here by reference, as follows:

9609271199

- a) No activities may be conducted at the property that may interfere with the groundwater monitoring and the continued protection of the Independent Remedial Action;
- b) No activities may be conducted that may result in the release of the petroleum hydrocarbon contamination capped by the press building, loading dock and asphalt paving identified as capping the petroleum hydrocarbon contamination in Figures 6 through 9 above;
- c) Water well(s) shall not be installed on the property for purpose of domestic water use;
- d) Written notification must be given to the WDOE or its successor agency before excavating, moving or removing the soils or material beneath the press building, loading dock, and asphalt paving which are capped by these structures. In the event the cement flooring and foundation of the press building or the loading dock are demolished, all TPH contaminated soils above applicable WAC 173-340-700 through 173-340-760 cleanup standards shall be removed and disposed of in accordance with applicable law or, in the alternative, appropriate sampling and testing shall be completed that documents that the remaining TPH contaminated soils are below applicable cleanup criteria. A report documenting

1995-1199 01:18:00 PM KING COUNTY RECORDS 005 SH 12:00

these facts shall be submitted to WDOE or its successor agency for review and approval.

- e) Written notification must be given to WDOE or its successor agency before removal or destruction of those areas of the existing press building, loading dock, or asphalt paving identified as capping the petroleum hydrocarbon contamination in Exhibit "B";
- f) Written notification must be given to the WDOE or its successor agency of owner's intent to convey any interest in the property. Further, no conveyance of title, easement, lease, or other interest in the property will be consummated by the owner of the property without notice of this Restrictive Covenant;
- g) The owner must notify WDOE or its successor agency, prior to any use of the property that is inconsistent with the terms of this Restrictive Covenant.
- h) The WDOE or successor agency or its designated representative shall have the right to enter the property after 24-hour prior notice, at reasonable times for the purpose of evaluating compliance with the terms of this Restrictive Covenant, to take samples and to inspect records related to the Independent Remedial Action;
- i) Upon remediation (by removal or otherwise) of the petroleum contaminated soil to below those levels set forth in Wash. Admin. Code 173-340-700 through 173-340-760, the owner may record an instrument stating that this restrictive covenant is of no further force or effect, provided the owner has the consent of the WDOE or its successor agency to so do.

9609271199

IN WITNESS WHEREOF, the undersigned has executed this instrument as of the 25 day of September, 1996.

1.0 INTRODUCTION

This document is a review by the Washington State Department of Ecology (Ecology) of post-cleanup site conditions and monitoring data to ensure that human health and the environment are being protected at the Journal American (Site). Cleanup at this Site was implemented under the Model Toxics Control Act (MTCA) regulations, Chapter 173-340 Washington Administrative Code (WAC).

Cleanup activities at this Site were completed under the Independent Remedial Action Program (IRAP). The cleanup actions resulted in concentrations of petroleum hydrocarbons remaining at the Site which exceed MTCA cleanup levels. The MTCA cleanup levels for soil are established under WAC 173-340-740. The MTCA cleanup levels for groundwater are established under WAC 173-340-720. WAC 173-340-420 (2) requires that Ecology conduct a periodic review of a site every five years under the following conditions:

- (a) Whenever the department conducts a cleanup action
- (b) Whenever the department approves a cleanup action under an order, agreed order or consent decree
- (c) Or, as resources permit, whenever the department issues a no further action opinion;
- (d) and one of the following conditions exists:
 - 1. Institutional controls or financial assurance are required as part of the cleanup
 - 2. Where the cleanup level is based on a practical quantitation limit
 - 3. Where, in the department's judgment, modifications to the default equations or assumptions using site-specific information would significantly increase the concentration of hazardous substances remaining at the site after cleanup or the uncertainty in the ecological evaluation or the reliability of the cleanup action is such that additional review is necessary to assure long-term protection of human health and the environment.

When evaluating whether human health and the environment are being protected, the factors the department shall consider include [WAC 173-340-420(4)]:

- (a) The effectiveness of ongoing or completed cleanup actions, including the effectiveness of engineered controls and institutional controls in limiting exposure to hazardous substances remaining at the site;
- (b) New scientific information for individual hazardous substances of mixtures present at the site;
- (c) New applicable state and federal laws for hazardous substances present at the Site;
- (d) Current and projected site use;
- (e) Availability and practicability of higher preference technologies; and
- (f) The availability of improved analytical techniques to evaluate compliance with cleanup levels.

The Department shall publish a notice of all periodic reviews in the Site Register and provide an opportunity for public comment.

2.0 SUMMARY OF SITE CONDITIONS

2.1 Site Description and History

The Journal American was an operating newspaper printing and publishing facility located at 1705 132nd Avenue NE, Bellevue, King County, Washington. Prior to the construction of the newspaper publishing facility, the property was occupied by Whitescarver Brothers Trucking and the Ace Bulldozing Company. The press building (southern building) was constructed in 1983 on the portion of the site historically used by the trucking and bulldozing companies. The southern portion became a separate parcel with a separate address of 1625 132nd Avenue NE, Bellevue. The usage is now Arnold's Appliance store and warehouse. A store front building appears to have been added to the press building. The contamination is on the southern parcel only. The northern parcel, the former Journal American Main Office, retains the 1705 132nd Avenue address. An additional covenant removed the northern parcel from the restrictive covenant and the cleanup. Goff Creek is north of Arnold's Appliance/ former press building.

Petroleum hydrocarbon contaminated soils (gasoline and diesel) were encountered at the Journal American press building facility in the vicinity of two decommissioned underground fuel storage tank areas and an associated fuel dispensing island. One underground storage tank area is north of the press building (north underground storage tank). This area consisted of two 5,000-gallon gasoline storage tanks. The other tank area is located south of the press building (south underground storage tank); this area consisted of a single tank. The fuel dispensing island for this tank was located beneath the press building in the area of the maintenance bay.

2.2 Site Investigations and Cleanup

Initially, 12 borings and one test pit were completed to investigate soil in the area of the two former underground storage tank farms (north and south of the press building). In addition, four shallow soil borings were completed around the printing press. Sample results from the initial borings and test pit detected petroleum-related contamination in soils in the vicinity of both the decommissioned tank locations. Approximately 75 tons of petroleum hydrocarbon contaminated soil was removed from the north underground storage tank area and taken to Regional Disposal Company for disposal at a Resource Conservation and Recovery Act (RCRA) Subtitle D landfill. Soil samples collected from the sidewalls and bottom of the soil excavation confirmed the removal of the contamination. No additional investigation or remedial action in the vicinity of the north underground storage tank area is known.

Four groundwater monitoring wells were installed in the vicinity of the former south underground storage tank to determine the possible presence of petroleum products in the site groundwater. A groundwater monitoring program was implemented because analysis of a water sample taken from an open borehole in the press building detected petroleum-related parameters for gasoline, diesel, and xylene in excess of the MTCA Method A cleanup level for groundwater. However, monthly groundwater sampling events conducted from September 1994 (date of well installation) through February 1995 detected no petroleum related contaminant constituents in

Site groundwater in concentrations that approach or exceed MTCA Method A cleanup levels. Sixty subsequent soil borings were completed within the press building and the area south of the press building to further delineate the horizontal and vertical depth of the petroleum hydrocarbon contamination detected in the south underground storage tank area. Approximately 40 tons of petroleum-contaminated soil was removed from the area immediately south of the press building in the vicinity of the former underground storage tank. Additional soil removal in this area was not possible because of concerns regarding the structural stability of the press building foundation wall by the excavation.

The majority of the remaining petroleum hydrocarbon contamination (approximately 430 cubic yards) associated with the south underground storage tank is located beneath the press building. Additional soil removal of contaminated soil was not possible because of the potential impacts to the structural integrity of the press building. Prior to issuance of a „No Further Action“ (NFA) determination by Ecology, a 4-inch asphalt cap was placed over the parking lot south of the press building to effectively “cap” the contamination left in place. Given that the source of the contamination (the underground storage tank) was removed some time prior to construction of the press building in 1983, most of the contaminated soil was removed, and that groundwater contamination is not present above cleanup levels, the cap is an effective containment measure.

Ecology issued a NFA letter on October 7, 1996, after the restrictive covenant was recorded.

2.3 Sample Results

Please see the preceding section as well as Ecology files for information regarding sample results.

2.4 Cleanup Levels

MTCA Method A cleanup levels were not met at a standard point of compliance, but a conditional point of compliance was established which was determined to be protective of human health and the environment.

2.5 Restrictive Covenant

Based on the site use, surface cover and cleanup levels, it was determined that the Site was eligible for a „No Further Action“ determination if a Restrictive Covenant was recorded for the property. A Restrictive Covenant was recorded for the Site in 1996 which imposed the following limitations:

- a) No activities may be conducted at the property that may interfere with the groundwater monitoring and the continued protection of the Independent Remedial Action;
- b) No activities may be conducted that may result in the release of the petroleum hydrocarbon contamination capped by the press building, loading dock and asphalt paving identified as capping the petroleum hydrocarbon contamination;
- c) Water well(s) shall not be installed on the property for purpose of domestic water use;

- d) Written notification must be given to the Washington Department of Ecology (WDOE) or its successor agency before excavating, moving or removing the soils or material beneath the press building, loading dock, and asphalt paving which are capped by these structures. In the event the cement flooring and foundation of the press building or the loading dock are demolished, all TPH contaminated soils above applicable WAC 173-340-700 through 173-340-760 cleanup standards shall be removed and disposed of in accordance with applicable law or, in the alternative, appropriate sampling and testing shall be completed that documents that the remaining TPH contaminated soils are below applicable cleanup criteria. A report documenting these facts shall be submitted to WDOE or its successor agency for review and approval.
- e) Written notification must be given to WDOE or its successor agency before removal or destruction of those areas of the existing press building, loading dock, or asphalt paving identified as capping the petroleum hydrocarbon contamination in Exhibit "B"
- f) Written notification must be given to the WDOE or its successor agency of owner's intent to convey any interest in the property. Further, no conveyance of title, easement, lease, or other interest in the property will be consummated by the owner of the property without notice of this Restrictive Covenant;
- g) The owner must notify WDOE or its successor agency, prior to any use of the property that is inconsistent with the terms of this Restrictive Covenant.
- h) The WDOE or successor agency or its designated representative shall have the right to enter the property after 24-hour prior notice, at reasonable times for the purpose of evaluating compliance with the terms of this Restrictive Covenant, to take samples and to inspect records related to the Independent Remedial Action;
- i) Upon remediation (by removal or otherwise) of the petroleum contaminated soil to below those levels set forth in Wash. Admin. Code 173-340-700 through 173-340-760, the owner may record an instrument stating that this restrictive covenant is of no further force or effect, provided the owner has the consent of the WDOE or its successor agency to so do.

The Restrictive Covenant is available as Appendix 6.4.

3.0 PERIODIC REVIEW

3.1 Effectiveness of completed cleanup actions

The Restrictive Covenant for the Site was recorded and is in place. This Restrictive Covenant prohibits activities that will result in the release of contaminants at the Site without Ecology's approval, and prohibits any use of the property that is inconsistent with the Covenant. This Restrictive Covenant serves to ensure the long term integrity of the asphalt and building as a cap.

Based upon the site visit conducted on November 4, 2009, the remedy at the Site continues to eliminate exposure to contaminated soils by ingestion and contact. The asphalt appears in satisfactory condition and no repair, maintenance, or contingency actions have been required. The Site is operating as an appliance store and warehouse. A photo log is available as Appendix 6.5.

Soils with TPH concentrations higher than MTCA cleanup levels are still present at the Site. However, the remedy, Site structure and asphalt surface, prevent human exposure to this contamination by ingestion and direct contact with soils. The Restrictive Covenant for the property will ensure that the contamination remaining is isolated, contained and controlled.

3.2 New scientific information for individual hazardous substances for mixtures present at the Site

There is no new scientific information for the contaminants related to the Site.

3.3 New applicable state and federal laws for hazardous substances present at the Site

The cleanup at the Site was governed by Chapter 173-340 WAC (1996 ed.). WAC 173-340-702(12) (c) [2001 ed.] provides that,

“A release cleaned up under the cleanup levels determined in (a) or (b) of this subsection shall not be subject to further cleanup action due solely to subsequent amendments to the provision in this chapter on cleanup levels, unless the department determines, on a case-by-case basis, that the previous cleanup action is no longer sufficiently protective of human health and the environment.”

Although cleanup levels changed for petroleum hydrocarbon compounds as a result of modifications to MTCA in 2001, contamination remains at the site above the new MTCA Method A and B cleanup levels. Even so, the cleanup action is still protective of human health and the environment. A table comparing MTCA cleanup levels from 1991 to 2001 is available below.

Analyte	1991 MTCA Method A Soil Cleanup Level (ppm)	2001 MTCA Method A Soil Cleanup Level (ppm)	1991 MTCA Method A Groundwater Cleanup level (ppb)	2001 MTCA Method A Groundwater Cleanup Level (ppb)
TPH	NL	NL	1000	NL
TPH-Gas	100	100/30	NL	1000/800
TPH-Diesel	200	2000	NL	500
TPH-Oil	200	2000	NL	500
NL = None listed				

3.4 Current and projected site use

The site is currently used for an appliance store and warehouse. There have been no recent changes in current or projected future site or resource uses since the use was changed from the press building.

3.5 Availability and practicability of higher preference technologies

The remedy implemented included containment of hazardous substances, and it continues to be protective of human health and the environment. While higher preference cleanup technologies may be available, they are still not practicable at this Site.

3.6 Availability of improved analytical techniques to evaluate compliance with cleanup levels

The analytical methods used at the time of the remedial action were capable of detection below selected site cleanup levels. The presence of improved analytical techniques would not affect decisions or recommendations made for the site.

4.0 CONCLUSIONS

The following conclusions have been made as a result of this periodic review:

- The cleanup actions completed at the Site appear to be protective of human health and the environment.
- Soils cleanup levels have not been met at the standard point of compliance for the Site; however, the cleanup action has been determined to comply with cleanup standards since the long-term integrity of the containment system is ensured, and the requirements for containment technologies are being met.
- The Restrictive Covenant for the property is in place and continues to be effective in protecting public health and the environment from exposure to hazardous substances and protecting the integrity of the cleanup action.

Based on this periodic review, the Department of Ecology has determined that the requirements of the Restrictive Covenant continue to be met. No additional cleanup actions are required by the property owner. It is the property owner's responsibility to continue to inspect the site to assure that the integrity of the remedy is maintained.

4.1 Next Review

The next review for the site will be scheduled five years from the date of this periodic review. In the event that additional cleanup actions or institutional controls are required, the next periodic review will be scheduled five years from the completion of those activities.

RESTRICTIVE COVENANT

~~Whereas~~ is hereby given that the property described on Exhibit "A" attached hereto and known as, the press building of The Journal American newspaper property, located at 1705 132nd Avenue, Bellevue, Washington, 98005, has been the subject of an Independent Remedial Action conducted under Wash. Rev. Code Section 70.105D (1993). Certain of the on-site soils are contaminated with petroleum hydrocarbons and are capped by the press building and its parking lot area, as depicted by Figures 6 through 9 of the INDEPENDENT REMEDIAL ACTION REPORT: The Journal American Facility, Bellevue, Washington (the "Report"), prepared by CH2M HILL, dated August 1995 and submitted to the Washington Department of Ecology's (WDOE), Northwest Region, Bellevue Washington. At the time of the Report, the maximum residual soil concentration of total petroleum hydrocarbon (TPH) gasoline was 1,200 milligrams per kilogram (mg/kg) at boring locations B04 at the 10 foot depth and B10 at the 7.5 foot depth and the maximum residual concentration of TPH diesel was 12,000 mg/kg at B04 at the 10 foot depth. These maximum soils concentrations exceed the Washington State Models Toxics Control Act (MTCA) Level A cleanup standards of 100 mg/kg gasoline in soil and 200 mg/kg diesel in soil. Until such time as this covenant is removed according to its terms, use of this property is restricted in accordance with Wash. Admin. Code (WAC) 173-340-440, which is incorporated here by reference, as follows:

960927-1199 01:48:08 PM KING COUNTY RECORDS 005 58 12.00

- a) No activities may be conducted at the property that may interfere with the groundwater monitoring and the continued protection of the Independent Remedial Action;
- b) No activities may be conducted that may result in the release of the petroleum hydrocarbon contamination capped by the press building, loading dock and asphalt paving identified as capping the petroleum hydrocarbon contamination in Figures 6 through 9 above;
- c) Water well(s) shall not be installed on the property for purpose of domestic water use;
- d) Written notification must be given to the WDOE or its successor agency before excavating, moving or removing the soils or material beneath the press building, loading dock, and asphalt paving which are capped by these structures. In the event the cement flooring and foundation of the press building or the loading dock are demolished, all TPH contaminated soils above applicable WAC 173-340-700 through 173-340-760 cleanup standards shall be removed and disposed of in accordance with applicable law or, in the alternative, appropriate sampling and testing shall be completed that documents that the remaining TPH contaminated soils are below applicable cleanup criteria. A report documenting

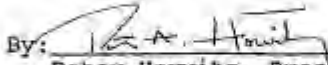

these facts shall be submitted to WDOE or its successor agency for review and approval.

- e) Written notification must be given to WDOE or its successor agency before removal or destruction of those areas of the existing press building, loading dock, or asphalt paving identified as capping the petroleum hydrocarbon contamination in Exhibit "B";
- f) Written notification must be given to the WDOE or its successor agency of owner's intent to convey any interest in the property. Further, no conveyance of title, easement, lease, or other interest in the property will be consummated by the owner of the property without notice of this Restrictive Covenant;
- g) The owner must notify WDOE or its successor agency, prior to any use of the property that is inconsistent with the terms of this Restrictive Covenant.
- h) The WDOE or successor agency or its designated representative shall have the right to enter the property after 24-hour prior notice, at reasonable times for the purpose of evaluating compliance with the terms of this Restrictive Covenant, to take samples and to inspect records related to the Independent Remedial Action;
- i) Upon remediation (by removal or otherwise) of the petroleum contaminated soil to below those levels set forth in Wash. Admin. Code 173-340-700 through 173-340-760, the owner may record an instrument stating that this restrictive covenant is of no further force or effect, provided the owner has the consent of the WDOE or its successor agency to so do.

IN WITNESS WHEREOF, the undersigned has executed this instrument as of the 15 day of September, 1996.

EXECUTIVE SUMMARY

The Shannon and Wilson Team has completed a Phase I Environmental Site Assessment for Sound Transit Right-of-Way (ROW) EL296, located at 1606 130th Avenue NE in Bellevue, Washington. Other addresses associated with the on-site structure include 1612, 1618, and 1628 130th Avenue NE. This study was conducted with the understanding that Sound Transit plans to acquire the subject parcel (ROW #EL296) as part of the East Link Light Rail Project, E340 Corridor.

The research conducted as part of this assessment indicates that the commercial structure at the subject parcel was constructed in 1962. The site is also developed with at-grade parking.

Based on our review of available information, it is the professional opinion of the Shannon and Wilson Team that two recognized environmental conditions (RECs) exist for the subject parcel.

- Staining from multiple chemical products used on site was noted in the office hallway sinks of the Wall Doctor tenant space. The chemical waste which was spilled or disposed of in these sinks may have leaked through the building piping into subsurface soils. Three drums labeled as containing “moderate risk waste” were observed on the concrete floor without secondary containment. The drums showed evidence of leaks and spills. The improper storage and disposal of hazardous wastes at the subject parcel presents a material threat of a release and is considered a REC.
- The former Journal American/Longview Publishing facility (EL297.1) is located adjacent northeast of the subject parcel. Seventy-five (75) tons of petroleum-contaminated soil and two underground storage tanks were removed from this up-gradient/cross-gradient property in 1995. Documentation confirming a final cleanup had been satisfactorily completed was not found. Therefore, the potential for residual contamination to impact the subject parcel from this property is considered a REC.

PHASE I ENVIRONMENTAL SITE ASSESSMENT
SOUND TRANSIT ROW #EL296
ELUFA
1606 130TH AVENUE NE
BELLEVUE, WASHINGTON

1.0 INTRODUCTION

The Shannon and Wilson Team has completed a Phase I Environmental Site Assessment (ESA) for Sound Transit East Link Right-of-Way (ROW) Number EL296 located at 1606 130th Avenue NE in Bellevue, Washington. The work was conducted under contract RTA/LR 164-09 with Sound Transit. This study was conducted to assist Sound Transit's plans to acquire the entire subject parcel as part of the East Link Extension, Contract E340 Project in Bellevue, Washington.

1.1 Purpose

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the process described in the ASTM International (ASTM) Practice E 1527-05 and E 1527-13 (Phase I ASTM standard) *recognized environmental conditions* (RECs), *controlled RECs* (CRECs), or *historical RECs* (HRECs) associated with the site. The term REC means:

The presence or likely presence of hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

The term CREC means:

A REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place **subject to the implementation of required controls** (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

The term HREC means:

A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, **without** subjecting the property to **any required controls**.

The terms REC and CREC are not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not RECs or CRECs.

The U.S. Environmental Protection Agency (EPA) has determined that the Phase I ASTM standard (E 1527-13) (ASTM, 2013) is consistent with and meets the requirements for performing All Appropriate Inquiry (AAI) and may be used to comply with federal AAI regulations at 40 Code of Federal Regulations Part 312. Washington State Model Toxics Control Act (MTCA) and Dangerous Waste Regulations define hazardous or dangerous wastes and/or substances, and contain information regarding discovery and reporting. State regulations were considered within the process of performing this Phase I ESA.

1.2 Phase I Environmental Site Assessment (ESA) Scope of Services

The scope of services included the following subtasks:

- Review of readily available information with respect to current uses of the property and its surroundings.
- Review of readily available information from various sources, including city directories, historical maps, and aerial photographs, with respect to the historical uses of the property and its surroundings.
- Review of state and federal databases of known and suspected contaminated sites.
- Visual reconnaissance of the property and cursory reconnaissance of the immediate site vicinity.
- Review of information related to the physical setting of the site.
- Preparation of this report.

The scope of this project does not include an evaluation of all environmental considerations that may be relevant to a particular transaction, such as testing for radon and mold, or evaluation of indoor air quality, potential wetlands, regulatory compliance, and health/safety matters. It also does not include any sampling or testing of air, soil, water, or building materials.

1.3 Roles

To complete this Phase 1 ESA, the Team utilized the following members:

- Ms. Lisa Kollasch (Senior Environmental Scientist, EHS-International, Inc., [EHSI]) collected data, completed the site visit and initiated reporting.
- Mr. Kurt Easthouse (Principal Hydrogeologist, EHSI) completed initial review of technical content and provided EHSI quality assurance review.
- Ms. Agnes Tiraó (Associate, Shannon & Wilson, Inc. [Shannon & Wilson]) completed review for programmatic consistency and compiled the report for production.
- Mr. Scott Gaulke (Vice President, Shannon & Wilson) completed final technical review of the report.

2.0 SITE DESCRIPTION AND PHYSICAL SETTING

The subject parcel is located in the northeast quarter of Section 28, Township 25 North, Range 5 East of the Willamette Meridian. The subject parcel is identified as King County tax parcel 282505-9159. The subject parcel is owned by Elufa, LLC. The site vicinity is shown in Figure 1, and a map of the site and adjoining properties is presented in Figure 2.

The property address is listed as 1606 130th Avenue NE in Bellevue, Washington. Other addresses associated with the on-site structure include 1612, 1618, and 1628 130th Avenue NE. The 51,250-square-foot (sf) parcel is occupied by a 23,316-sf commercial building with parking areas. The property is adjoined by commercial retail properties to the north and east, Kelly's Autobody to the south. Adjoining to the west is 130th Avenue NE, Cadman, Inc., and a retail/light industrial park.

Site elevation ranges approximately from 199 feet above mean sea level (MSL) at the north end to 192 feet MSL at the south end. Surrounding topography generally slopes gently down toward the south.

3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING

This section describes the general geologic setting of the site vicinity and discusses the subsurface conditions beneath the site and surrounding area as they relate to the potential for contamination to migrate through the soils and groundwater.

3.1 Regional and Site Geologic Setting

Bellevue is located in the central portion of the Puget Sound Basin, an elongated, north-south-trending depression situated in western Washington between the Olympic Mountain Range to the west and the Cascade Mountain Range to the east. Regional topography was shaped mainly by repeated glaciations that moved back and forth across the region over 10,000 years ago, leaving a thick deposit of unconsolidated soils and creating a series of north-south-trending ridges separated by deep troughs. The troughs are now occupied by streams, lakes, and waterways, including Puget Sound, Lake Washington, and Lake Sammamish.

Several explorations were advanced in the E340 Corridor and on the subject site to collect geotechnical and hydrogeological data in support of previous East Link Light Rail studies (CH2M Hill, 2011; H-J-H Design Partners [H-J-H], 2014a). Two soil borings (E340-B-023 and E340-B-024) were drilled on the subject parcel during one of the geotechnical investigations. Boring E340-B-023 reported up to 5.5 feet of fill underlain by a mix of sand and silt to 16.5 feet. Boring E340-B-024 reported up to 6 feet of fill with a mix of gravel, sands, and silts to 16.5 feet.

3.2 Regional and Site Groundwater

Information regarding groundwater depth and flow direction was obtained by reviewing the Environmental Data Resources, Inc., (EDR) report (2014a, 2014b), Washington State Department of Ecology (Ecology) files and the Sound Transit East Link, South Bellevue to Overlake Transit Center Geotechnical Data Report (H-J-H, 2014a), and Geotechnical Recommendations Report (H-J-H, 2014b).

Groundwater conditions at the site include a regional aquifer that is primarily within the pre-Vashon fluvial deposits and a shallow perched aquifer above the glacial till and lacustrine deposits. The groundwater elevation within the regional aquifer is approximately elevation 178 feet (12 feet below ground surface [bgs] at the site) and the flow direction is west. The regional aquifer is confined by overlying till and lacustrine deposits, and wells installed within the regional aquifer near Kelsey Creek (on EL287) show artesian conditions with water levels measured approximately 12.5 feet above ground (approximately elevation 150 feet). Shallow groundwater has been observed near ground surface perched on the till and lacustrine deposits. The extent of the perched groundwater and flow direction will vary depending on the localized topography and geology.

Depth to groundwater near the site was measured approximately 12 feet bgs (elevation 178 feet) in monitoring well E340-B-019 and approximately 5 feet bgs (elevation 188 feet) in monitoring well E340-B-022. Monitoring well E340-B-019 is located southwest of the site in 130th Avenue

NE and is screened approximately 90 feet bgs within the regional aquifer. Monitoring well E340-B-022 is located about 200 feet east of the EL296; it is screened approximately 15 feet bgs within the perched aquifer. The direction of groundwater flow within the regional aquifer is to the west.

The direction of perched groundwater flow was measured to be to the southwest on the west-adjacent parcel (EL290) (HartCrowser, 1999). A southerly groundwater flow direction was estimated on east adjacent parcel (EL299) (CH2M Hill, 1995). Based on this information, we estimate the direction of perched groundwater flow beneath the subject parcel to be to the south and southwest.

4.0 SUBJECT PARCEL HISTORY

The history of land use for the subject parcel was evaluated to identify past uses that might have had adverse effects on the environmental conditions of the property, primarily through the use of potentially hazardous materials. The historical information was obtained by reviewing readily available data from public agencies and library resources.

The following site history is based on a compilation of information obtained from the following resources:

- Aerial photographs (1944, 1965, 1968, 1977, 1980, 1985, 1990, 2005, 2006, and 2011) (EDR, 2014c).
- Aerial photographs from King County's geographic information system (1936, 1998, 2000, 2002, 2005, 2007, and 2009).
- Kroll Atlas (1960, 1965, and 1970).
- Historical Topographic Maps obtained from EDR (1950, 1968, 1973, 1982, and 1983) (EDR, 2014d).
- Cole Information Services – Bellevue, Washington (1971, 1976, 1981, 1986, 1992, 1995, 1999, 2003, 2008, and 2013) (EDR, 2014e).
- King County Assessor's current and archive records.
- Sanborn Maps (none available for subject parcel and adjacent areas) (EDR, 2014f).

4.1 Subject Parcel

The 1936 and 1944 photographs show the subject parcel as undeveloped land covered with vegetation. The 1965 photo shows the subject parcel developed with one rectangular-shaped building. The 1968 photo is not clear, but appears to show the property the same as depicted in the 1965 photo. In the 1977 photo, the single rectangular building is seen and parking areas

along the north, west, and south perimeters are also visible and generally looks as it does today. In the 1980 through 2011 photos, the subject parcel appears unchanged.

The Kroll Atlas displays the parcel as being part of a larger privately owned parcel in 1960 and 1965. The 1970 atlas exhibits this previously larger parcel as being segregated into three separate smaller parcels.

The 1950 historical topographic map displays the property as vacant land. One rectangular shaped structure is visible in the 1968, 1973, and 1983 maps.

The subject parcel contains multiple tenant spaces. The Cole Directories list the following businesses:

- 1606 130th Avenue NE: Stusser Electric (1971, 1976, 1981, 1986, 1992, 1995, 1999, and 2003); Eastside Durham Upholstery, Inc. (2008); and Grand Event Rentals (2008 and 2013).
- 1612 130th Avenue NE: Fastenal (2013)
- 1618 130th Avenue NE: The Wall Doctor, Inc. (2013)
- 1628 130th Avenue NE: Wes-Con Development and Campsites of America (1971); McLean, Inc. (1976, 1981, and 1986); Instruments Supply (1986); and Comtech Financial Corporation (1995, 1999, 2003, 2008, and 2013)

Historical archive tax records indicate that the fee owner was Andover Investment Company in December 1961. The existing single-story concrete masonry block building with a concrete foundation was built in 1962. The building is noted to have a mixture of electrical, gas, and baseboard heating systems. A hand-drawn floor plan of the building shows a warehouse and a sales and display area in the original 1962 construction section of the building with office areas, a plumbing warehouse, and two storage areas in a 1967 building addition. A 1962 photo of the subject parcel shows the name Stusser Electric on the side of a building. Copies of archive tax records are included in Appendix A.

The current King County Assessor records indicate that the single-story subject parcel building was constructed in 1962. It is comprised of warehouse office and storage spaces and is heated with space heaters. Sales history includes: the sale from Andover Investment Company to Stusser Electric Company (November 1, 1993); the sale from Andover Investment Company to SGB LLC (July 5, 1995); the sale from SGB LLC to Les Real Estate Holdings LLC (February 14, 2005); and lastly, the sale to the current owner, Elufa LLC (February 6, 2009). Permit history includes one remodel permit issued in March 2009 for the removal of five interior walls and cabinets.

4.2 Adjacent Site History

Histories of adjacent properties are discussed in a clockwise order beginning with the property to the north.

4.2.1 Adjacent Property to the North – 1700 130th Avenue NE (EL297)

Historical 1936 and 1944 aerial photos show the southern half of the north-adjointing property parcel as undeveloped and covered with vegetation while the northern half had been cleared and graded with an agricultural field on the eastern portion. In the 1965 photo, the southern half of the parcel is still undeveloped with vegetation and the agricultural field in the northeastern portion is no longer shown. The 1968 photo is unclear, but appears to show no change. Beginning in 1977, the aerial photographs show a warehouse structure to the northeast of the parcel along with parking and vegetative cover for the remainder of the property. The 1985 aerial photo shows an addition to the southeast of the warehouse. The aerial photographs show the warehouse with addition in its current configuration from 1990 through 2011.

The 1960 and 1965 Kroll maps show this area as one parcel under private ownership. In the 1970 map, this parcel has been reduced in size. Ownership is not listed.

The 1950, 1968, and 1973 historical topographic maps show this area as vacant land. The 1982 map show a rectangular-shaped structure on this property.

There is no listing in the 1971 and 1976 Polk and Cole Directories for this adjacent property (1700 124th Avenue NE). The 1981 directory lists Aiphone USA, Inc. and Deroche & Co., Inc. The 1986, 1992, 1995, and 1999 listings have Aiphone Intercom Systems as the only tenant. The 2003 listing shows Aiphone Communications Systems, Airphone Corporation, and an unknown occupant. The 2008 and 2013 directories show Aiphone Corporation as the only occupant.

An undated King County Assessor's tax card has a hand-drawn floor plan of the structure noting rooms including a warehouse, engineer repair, parts-service, shipping, and two office areas. One office area is noted as being occupied by a lessee named De Rouche & Co. One section is noted to be an addition added pre-1986 with no permit. The mezzanine level is used for storage and the building substrate is concrete. Space heaters are noted to be used in the warehouse while electric baseboard and a Heating, Ventilation, and Air Conditioning (HVAC) system are present in the office areas.

Current King County Assessor's records indicate the property was developed with a single-story office and warehouse masonry structure with a mezzanine level in 1977. The

building utilizes a warmed and cooled air HVAC system and the current owner is the Aiphone Corporation. One building permit is noted as being issued for an interior remodel in December 2008 for the introduction of partitions and walls to enclose the open warehouse and create workspace.

4.2.2 Adjacent Property to the Northeast – 1705 132nd Avenue NE (EL297.1)

The 1936, 1944, 1965, and 1968 aerial photos display the parcel as partially forested vacant land. The 1977 through 2011 photos show this property as it currently exists, with an irregular-shaped structure with at-grade parking.

The topographic maps display the property as vacant land from 1950 to 1973. The 1982 map displays the east adjoining structure on the property as it currently exists.

The Kroll Atlas displays the parcel as being part of two larger privately owned parcels from 1960 through 1965. The 1970 atlas exhibits this parcel as spanning two parcels with no further information given.

Cole Historical Street Directories begin listing the property addresses of 1700 132nd Avenue NE in 1976 as Familian NW, Inc. The property address of 1705 132nd Avenue NE is also listed beginning in 1981. Other listings for these two addresses include: Familian NW, Inc. and Journal American Newspaper (1981 and 1986); Journal American, Familian Northwest and Northwest Media (1992); Familian Corp. (1995); Familian Northwest, Inc., Eastside Journal, Journal American, and Northwest Media (1999); Familian Northwest, Eastside Journal, Northwest Media, Inc., and two unknown occupants (2003); Ferguson Enterprises, Inc., FNW Ferguson, and Northwest Medical Washington LP (2008); and FNW Ferguson and King County Journal (2013).

King County Assessor's records describe the two-story masonry office building as heated with heat pumps and built in 1977. Sales history includes the February 28, 1986, sale from Newspaper Partners to Longview Publishing and the subsequent sale on May 18, 2006, from Northwest Media LP to PBNK Development, LLC, which is the current owner.

4.2.3 Adjacent Properties to the East – 1625 132nd Avenue NE (EL299)

The 1936, 1944, and 1965 photographs show the area to the adjacent east of the subject parcel as undeveloped land covered with vegetation. The 1968 photo is not clear, but appears to show this area as cleared and graded. The 1977 and 1980 photos show a small, rectangular building, which appears to be connected to the northeast corner of the site building. The rest of this area is a vacant paved lot. In the 1985 photo, the small, rectangular building has been

replaced with a larger square-shaped structure spanning the east adjoining side of the subject building. The 1990 photo appears unchanged. The 1998 photo shows an additional square-shaped building added on to the east side of the east adjacent building. This addition was replaced with a much larger polygon-shaped addition in 2005. No changes were noted in the 2006 through 2011 photographs. The 2011 photograph shows the site as it generally looks today.

The 1960 and 1965 Kroll maps show the east-adjoining parcel as part of a larger tax lot that includes the existing subject parcel. The parcel is under private ownership. The 1970 map shows the land adjacent to the east as a separate parcel. Ownership is not noted.

None of the available historical topographic maps show development on the east-adjoining property.

The 1971 through 1981 Cole Directories list Whitescarver Bros. and ACE Bulldozing Co. as occupants (1625 132nd Avenue NE). The 1986 through 2008 directories have no listings for this property. The 2013 directory lists Arnold's Appliance and Lexus of Bellevue as occupants.

Archive tax assessor records indicate that the site was developed with a 4,850-sf shop building in 1969 that was occupied by Ace Bulldozing. The heat source for the building is noted as oil and an oil storage room is depicted at the northwest corner of the building. The fee owners in 1969 were Bill and Elvin Whitescarver.

Assessor records indicate the existing single-story with mezzanine level concrete structure was built in 1983. The building is described as a warehouse with space heaters for heating. The property is currently owned by Enilom Properties, LLC.

4.2.4 Adjacent Property to the Southeast – 1525 132nd Avenue NE (EL298)

The parcel to the southeast was formerly part of a larger 4.83-acre tax lot that included the adjacent south parcel (EL295) from at least 1920 until it was segregated by 1984. King County aerial photographs indicate that in 1936 a single-family residence comprised the southeast half of the parcel with forested vegetation comprising the northwest half. Land use seen in the 1944 aerial photograph is consistent with that seen in 1936. Archive tax records document a fuel distribution facility on the property beginning in 1962. The archive records indicate that the property was owned and operated by Mobil Oil Co. with a noted use of fuel storage. The bulk fuel distribution facility was equipped with two, 20,000-gallon, vertically oriented aboveground storage tanks (ASTs) and a fill rack. The 1965 aerial photograph shows this historic fueling system located on the central portion of the property. The 1977 aerial

photograph shows that the fueling facility had been removed. Assessor records indicate that the existing office building was constructed on the property in 1984. No directory listings are noted until 1986 when Kelley Clarke is listed. Campbell Sales Company and “occupant unknown” are listed for 1995; no listings were noted for 1999 through 2003. By 2008, Finishing Touch and Rod Nicholas Finishing Touch were listed and were also present in the 2013 directory. The 1985 through 2009 aerial photographs show the parcel with the three existing buildings.

4.2.5 Adjacent Properties to the South – 1500 130th Avenue NE (EL295)

The 1936 and 1944 photographs show the adjacent area south of the subject parcel as undeveloped land covered with vegetation. In the 1965 photo, the adjoining property has been cleared and graded with a rectangular shaped building on the eastern portion of that lot. The 1968 photo is not clear, but appears to show this area the same as depicted in the 1965 photo. The 1977 and 1980 photos show a rectangular-shaped commercial building to the southeast of the subject parcel surrounded by paved parking areas. In the 1985 photo, three additional commercial structures are noted at the southeast corner of the southeast adjoining property and generally looks as it does today. The 1990 through 2011 photos appear unchanged.

The 1960 and 1965 Kroll maps show the area adjacent to the south as one parcel under private ownership. The 1970 map shows this parcel as being owned by Mobil Oil.

The 1950 historical topographic map shows this property as vacant land. The 1968, 1973, and 1983 maps show a rectangular-shaped structure in its current configuration.

The 1971 Polk Directory lists Cascade Garage as the occupant (1500 130th Avenue NE). No occupants are listed on the 1976 directory. The 1981 directory lists Eastside Auto & Truck, Eastside Wheel & Frame, and Kelly’s Body Shop as occupants. The 1986 directory is the same as 1981 with an additional listing for Kelly’s Eastside Wheel. The 1992 directory lists Eastside Wheel and Frame Service, Eastside Auto & Truck Repair, and Kelly’s Body Shop. The 1995 directory lists Eastside Wheel & Frame Service only. The 1999 directory lists Eastside Wheel and Frame Service, Eastside Auto & Truck Repair, and Kelly’s Body Shop. The 2003 directory lists Kelly’s Eastside Wheel & Frame, Inc. and Raymond Kelly. The 2008 directory lists Kelly’s Auto Body Shop and the 2013 listing is Kelly’s Eastside Wheel & Frame Service.

A 1939 archive tax card noted a single family residence was built on this property in 1923. The structure had a stove heater and an outhouse; a garage, shed and lean-to were on site. The stated land use is residential farming and the property owner was S. Rasmussen. A 1971 card notes “Tanks added” with a date of 10-23-62. The site owner is Harms Pacific Transport

Co. and a single-story office building with a 1960 construction date is noted on site. The current garage building is noted to have been constructed in 1962 and was described as a “truck shop.”

Current Assessor records indicate this single-story masonry structure was built in 1962. The structure described as a warehouse and a service repair garage. The building uses a hot water heating system and is currently owned by Kelly Raymond.

4.2.6 Adjacent Property to the Southwest – 1501 130th Avenue NE (EL293)

Historical aerial photographs show the parcel adjacent to the southwest as vacant in 1936 and 1944. Clearing and grading was evident on the 1965 aerial photograph and the existing building was present from at least 1977 through 2011.

Historic Polk and Cole reverse street directories document that the parcel adjacent to the southwest of the subject property was occupied by various auto service, offices and commercial retail companies from at least 1971 through 2013.

4.2.7 Adjacent Properties to the West – 1605 130th Avenue NE (EL290)

The 1936 and 1944 photographs show a rural roadway adjacent west of the subject parcel with vacant undeveloped land that is partially forested. In the 1965 photo, 130th Avenue NE is seen to the adjacent west with a single family residence surrounded by vegetation beyond. A gravel and concrete batch plant operation is shown occupying the site. The 1968 photo is not clear, but appears to show this area similar to the 1965 photo. No changes are noted in the 1977 through 2005 photos. Cleared land is noted in the 2006 photo where the single-family residence was located previously. The surrounding vegetation appeared unchanged. No changes were noted in the 2011 photo and it generally looks as it does today.

The 1960 and 1965 Kroll maps show 130th Avenue NE adjacent west with parcels under private ownership beyond. The 1970 map shows 130th Avenue NE with one large parcel occupied by Lakeside Gravel.

The 1950 historical topographic map shows this area as vacant land. The 1968 and 1973 maps show three small structures on this property. The 1983 map shows one structure on this property.

No listings were found in the Cole Directories for the west adjacent property (1605 130th Avenue NE). One listing for an unknown occupant was found in the 2003 listing for 1701 130th Avenue NE.

Archived assessor records indicated that the site was owned by Hattie Norman in either 1914 or 1915 and the site was covered with brush and used for residential farming purposes. In 1939, the property was owned by Willem A. Frastex and also listed as being used for residential farmland. A single-family residence was constructed on the site in 1946 with an oil-fired heat source and reportedly burned down around 1995. The residence had indoor plumbing and an associated garage was noted to have a dirt floor. By 1956, a small office and concrete batch plant were located on the property.

Assessor records indicate the west-adjacent property is used for mining/quarry/ore processing purposes. The property has a single-story, wood-frame office building constructed in 1946, and a single-story, wood-frame storage warehouse constructed in 1960. The heating systems for both structures are unknown. This property is currently owned by Cadman, Inc.

5.0 RESULTS OF VISUAL RECONNAISSANCE

Ms. Lisa Kollasch conducted a visual reconnaissance of a portion of the subject parcel on October 23, 2014. The purpose of the reconnaissance was to identify visible indications of hazardous or potentially hazardous substances that were historically used or are currently used, generated, stored, or disposed of on the subject parcel.

Ms. Kollasch was unaccompanied while viewing the interior of the building. The subject building is currently occupied by CrossFit 425, The Wall Doctor, Inc., and Grand Event Rentals. Access was granted only for the CrossFit 425 and Wall Doctor tenant spaces. CrossFit 425 is a gym located in the northeast corner of the building and does not generate any hazardous wastes in their operations. The Wall Doctor is a contracting business located in the northern portion of the building and uses hazardous substances such as acetone, paint thinner, and varnishes in their operations. The Grand Event Rentals space was much larger than the others and comprised the remainder of the building.

Representative photographs taken during the site reconnaissance are provided in Appendix B. A visual reconnaissance of adjoining properties was also conducted during this site visit, but was restricted to what could be observed from public areas. A site visit checklist which documents field observations is included in Appendix C.

5.1 Subject Parcel

5.1.1 Exterior

A single-story office building with multiple tenant spaces and associated paved parking areas occupies the site (Photo 1). The surface parking lots cover the north and west parts of the

subject parcel, a loading area occupying the south portion of the parcel (Photos 1, 2, and 3). Storm drains were noted in the north and south parking areas while one drain of an unknown type was also noted in the north exterior. One sewer manhole was noted in the southwest exterior area. No staining was noted on pavements. A chain link fence defines the north parcel boundary (Photo 4). The east exterior wall of the subject building lies along the shared parcel boundary and abuts the east-adjacent building (Photo 5). High-intensity discharge lighting was noted on the building exterior (Photo 5) while fluorescent lighting was noted in building interiors (Photos 6 and 7).

5.1.2 Interior – CrossFit 425

Interior building features noted during the reconnaissance include a gym, office areas and restrooms (Photo 6). Housekeeping appeared to be good throughout the CrossFit 425 tenant space with no evidence of leakage or spills.

5.1.3 Interior – Wall Doctor, Inc.

One flammable chemicals cabinet, which had evidence of spills on it, was noted in the hallway outside the paint booth in the Wall Doctor, Inc. tenant space (Photo 8). Poor housekeeping was noted throughout the office area hallway where disposal drums were kept. Three, 55-gallon steel drums were staged in the hallway with multiple items stored on top of them and without any secondary containment. Evidence of spills and floor staining was observed on and around the three drums. One of the drums was labeled as containing toluene and acetone. A second drum held latex paint and water-based coatings. A third drum reportedly contained mineral spirits and xylene waste chemicals and was labeled as “moderate risk waste” and flammable. The third drum was not securely closed at the time of our site visit (Photos 9 and 10). Staining was observed on the walls, floors, sinks, and shelving of this hallway (Photos 11 and 12). No floor drains were observed within the Wall Doctor tenant space. Sporadically spaced areas with slight cracking and weathering were noted in the concrete slab. Similar evidence of staining and spillage were noted in the paint booth (Photos 13 and 14). A storage closet in this hallway was noted to store multiple chemicals including bleach, caulking, pesticides, adhesive remover, spray adhesive, compressor oil, concrete crack filler, and shellac. Container sizes varied from approximately 12 ounces to 1 gallon. No evidence of leaks or spills was noted in this closet (Photo 15).

5.1.4 Interior – Grand Event Rentals

Access was not allowed to the interior of the Grand Event Rentals tenant space.

5.2 Adjacent Properties

The following observations were made of the adjoining properties:

The subject parcel is adjoined by 130th Avenue NE to the west with the Cadman concrete batch plant property beyond (Photos 16 and 17). The Cadman property (EL290) has vegetation on all perimeter boundaries with a largely open central area. A tall concrete batch plant is present on the northern half of the parcel with dumpster storage on the southern half.

Aiphone (EL297), consisting of a single-story structure with warehouse and office spaces is located adjacent to the north (Photo 18).

A two-story office building occupied by Spectrum Controls is located adjacent to the northeast of the site.

Arnold's Appliance (EL299), consisting of a single-story commercial building with at grade parking, is located to the adjacent east (Photo 19).

A group of three single-story office buildings comprising the Curran Business Park (EL298) is located southeast of the site.

Kelly's Autobody (EL295), consisting of a single-story auto service garage with at grade parking is located to the adjacent south (Photo 20).

One groundwater monitoring well was observed in the 130th Avenue NE ROW just southwest of the subject parcel (Photo 21). This appears to be one of the East Link design team explorations (E340-B-019).

To the southwest (across 130th Avenue NE), is the Evans Industrial Park (EL293).

6.0 RESULTS OF ENVIRONMENTAL RECORDS REVIEW

Regulatory agency records were reviewed for the subject parcel and nearby properties to identify known or potential sources of contamination that could adversely impact the subject parcel. The Shannon & Wilson Team authorized EDR to conduct a search of EPA, Ecology, and local and tribal environmental databases that contain information regarding environmental conditions at and near the subject parcel. The EDR report (2014a, 2014b) was reviewed for accuracy of site locations. The complete EDR report, including figures identifying locations of reportable sites within 1 mile of the subject parcel, is provided in Appendix D.

6.1 Environmental Data Resources, Inc. (EDR) Report Review

Numerous sites within the selected search radii are listed in the local, state, and/or federal databases that were reviewed. Some of the sites are listed in multiple databases. Table 1 includes information about listed sites with confirmed or suspected contamination that are within approximately ¼ mile of the subject parcel for sites that are potentially up-gradient (north and east). The table also includes information about such sites within approximately 400 feet in other directions from the subject site. Other sites identified by the EDR search were not reviewed further because they are:

- Located down- or cross-gradient from the subject parcel and greater than 400 feet away.
- Too far away, based on the contaminant type, to likely affect the subject parcel.
- Registered only as generators of hazardous waste with no disposal or reporting violations and no documented evidence of contaminant releases.
- Listed in the state underground storage tank (UST) database but not listed in state and/or federal databases that would indicate that a release has occurred.
- Not known to have contamination.

Out of the nine sites listed in Table 1, four were excluded from further evaluation based on remediation status, distance from the subject site, and/or a low hazard ranking.

6.2 File Review

Based on their locations and distances from the subject parcel, as well as types of contaminants and indications of potential groundwater impacts, four sites listed in Table 1 were selected for further review and are discussed below. Site information was collected from the EDR report, and Ecology's Northwest Regional office in Bellevue, Washington. A copy of the file documentation from Ecology is included in Appendix E.

6.2.1 1605 and 1701 130th Avenue NE (EL290)

The Cadman Premix Co., Inc. (Cadman) site is listed on the Recovered Government Archive (RGA) Hazardous Waste Site, Facility Index System/Facility Registry System (FINDS), Confirmed and Suspected Contaminated Sites List (CSCSL), and Facility/Site Identification Listing (ALLSITES) databases. The Cadman site is located adjacent to the subject parcel to the west in an inferred cross-gradient position with respect to groundwater flow. Cadman performed a soil remedial action in 1998 in regards to releases associated with a former AST shed and two diesel USTs (HartCrowser, 1998). Total petroleum hydrocarbons (TPH)-impacted soil

(323 tons) was excavated and removed off-site for recycling. Groundwater wells were installed and showed the groundwater flowed to the west/southwest away from the subject parcel. The reported concentration of diesel in the post-remediation down-gradient well was at 269 micrograms per liter ($\mu\text{g/L}$), which is below the MTCA Method A Cleanup Level of 500 $\mu\text{g/L}$ (HartCrowser, 1999). Based on the groundwater flow direction away from the subject parcel and the reported groundwater concentrations below MTCA, the reported release at the Cadman site is not likely to impact the subject parcel.

6.2.2 1705 132nd Avenue NE (EL297.1)

Journal American/Longview Publishing appears on the Resource Conservation and Recovery Act Non-Generator (RCRA-NonGen), FINDS, RGA leaking underground storage Tank, and Independent Cleanup Report databases. This facility was located adjacent to the northeast of the subject parcel in an up-gradient to cross-gradient hydrologic position. The Journal American newspaper formerly operated on this property. A review of reports indicates that two gasoline USTs and approximately 75 tons of petroleum contaminated soil were removed from the Journal American property in 1995 (CH2M Hill, 1995). Confirmation sampling at the final limits of the remedial excavation documented the removal of the contamination.

On August 10, 1998, Ecology sent a single-page letter to Longview Publishing Company stating that Ecology did not receive a final cleanup report for the Journal American facility (Ecology, 1998). The letter informed the property owner that MTCA requires submittal of final cleanup reports within 90 days of completion of the cleanup action.

Given the lack of information regarding groundwater quality at this up-gradient to cross-gradient facility, a release to groundwater may have occurred, potentially impacting the subject parcel.

6.2.3 1500 130th Avenue NE (EL295)

Kelly's Autobody is listed on the EDR Historic Auto Station, RCRA-Conditionally Exempt Small Quantity Generator, FINDS, Manifest Data, ALLSITES, and UST databases. Kelly's Autobody is adjacent south of the subject parcel, in an assumed down-gradient position with respect to groundwater flow. The Ecology file had a 30-day notice for removal of a 5,000-gallon UST containing gasoline, but no further information from the tank removal. EDR listed the site on their proprietary listing as an historic auto station, but provided no information in regards to a release.

The Kelly's Autobody site does not appear to present a risk to the subject parcel. There is no documentation of a release from this site and it is located in a likely down-gradient position in regards to groundwater flow.

6.2.4 1625 132nd Avenue NE (EL299)

The former Journal American site is listed on the ALLSITES, RCRA NonGen, UST, CSCSL-No Further Action, and Institutional Control databases. The Journal American was located adjacent to the east of the subject parcel in an inferred cross-gradient position with respect to groundwater flow. This site has had a documented release to soil and groundwater from former USTs and associated fuel dispensing islands located near the southern property boundary. The contamination was discovered in 1994 after the site had been redeveloped and a former press building constructed over part of the area of contamination. Remediation of the contamination involved excavation, but approximately 430 cubic yards were left in place due to concerns with the structural integrity of the building. The contaminants of concern were identified as TPH as gasoline, TPH as diesel, and benzene, toluene, ethylbenzene, and xylenes.

Groundwater monitoring wells were installed in 1995 and 1996 and documented groundwater flow to the south. The groundwater sampling from the monitoring wells documented gasoline (non-detect to 400 µg/L) and diesel (non-detect to 580 µg/L), both below the MTCA Method A Cleanup Levels at the time (1,000 µg/L for both gasoline and diesel). MTCA was revised in 2007 and 2013 and the cleanup level for diesel has been reduced to 500 µg/L, indicating that some of the past groundwater data was out of compliance in terms of diesel.

A Phase II ESA was conducted in 2007 and testing of soil and groundwater was conducted for gasoline and BTEX and all of the results were below MTCA Method A Cleanup Levels. However, no samples were analyzed for diesel so groundwater quality in regards to this compound is unknown.

Based upon the cross-gradient position with respect to groundwater flow, the release at the Journal American site appears unlikely to impact the subject parcel.

7.0 PREVIOUS ENVIRONMENTAL REPORT REVIEW

Prior to finalization of this report, we received a copy of a Phase I ESA previously completed for the property (Environmental Associates, Inc. [EA], 2005). This report was provided to Sound Transit on February 18, 2015, and is included in Appendix F. (This report also references a 1995 study EA completed for the property.)

The report indicates that: (1) the (2005 and 1995) assessments revealed no RECs associated with the property, and (2) based on an 1995 interview, groundwater flow beneath the Journal American site is to the east, testing found no contamination in groundwater, and that a final report documenting both conclusions was in progress.

Note that the previous reports were published prior to use of the property by Wall Doctor, Inc., where use of hazardous materials was observed during the site reconnaissance, and no Ecology documentation was available to confirm the groundwater quality or flow direction at the Journal American site.

8.0 INTERVIEW AND USER-PROVIDED INFORMATION

8.1 Interview

Interview questions were submitted to Ms. Tsang Lim on October 13, 2014. On November 13, 2014, Ms. Lim indicated that she will not be participating in the interview.

8.2 User Provided Information

The Shannon & Wilson Team sent Sound Transit a questionnaire asking if Sound Transit had any specialized knowledge regarding the site, and whether Sound Transit was purchasing the subject parcel below its market value. Sound Transit completed the questionnaire on October 21, 2014. Sound Transit was not aware of any liens or activity use limitations for the property. Sound Transit was not aware of releases or past releases at the property. Sound Transit did not know if the purchase price reflected fair market value for the property.

A copy of the completed user questionnaire is included in Appendix F.

9.0 DATA GAPS

Within the context of our all appropriate inquiry for recognized environmental conditions at the subject site, we have identified the following data gap:

- **No 50-year chain of title or environmental lien searches were provided.**
 - *The **significance** of this data gap is unknown. If this information is provided to us, we will review it and issue an addendum to the report if any of our conclusions or recommendations are altered.*

- **No interview with the site owner was conducted.**
 - *The **significance** of this data gap is unknown. If the interview is completed at a later date, we will issue an addendum to the report if any of our conclusions or recommendations are altered.*
- **Partial site visit was conducted.**
 - *The **significance** of this data gap is unknown. If access is granted to the Grand Event Rentals tenant space at a later date, we will issue an addendum to the report if any of our conclusions or recommendations are altered.*

10.0 SUMMARY OF FINDINGS AND CONCLUSIONS

The Shannon & Wilson Team have performed a Phase I ESA in conformance with the Scope and Limitations of ASTM Practice E 1527-13 for the subject property located at 1606 130th Avenue NE in Bellevue, Washington. Any exceptions to, or deletions from, this practice are described in Section 9.0 of this report.

Based on our review of available information, it is the professional opinion of the Shannon & Wilson Team that two potential RECs exist for the subject parcel.

- Staining from multiple chemical products used on site was noted in the office hallway sinks of the Wall Doctor tenant space. The chemical waste which was spilled or disposed of in these sinks may have leaked through the building piping into subsurface soils. Three drums labeled as containing “moderate risk waste” were observed on the concrete floor without secondary containment. The drums showed evidence of leaks and spills. The improper storage and disposal of hazardous wastes at the subject parcel presents a material threat of a release and is considered a REC.
- The former Journal American/Longview Publishing facility (EL297.1) is located adjacent northeast of the subject parcel. Seventy-five (75) tons of petroleum-contaminated soil and two USTs were removed from this up-gradient/cross-gradient property in 1995. Documentation confirming a final cleanup had been satisfactorily completed was not found. Therefore, the potential for residual contamination to impact the subject parcel from this property is considered a REC.

11.0 LIMITATIONS, UNCERTAINTY, AND RISK

This Phase I ESA was conducted to render a professional opinion about the likelihood of regulated contaminants being present on, in, or beneath the site at the time services were conducted. No matter how thorough a Phase I ESA study may be, findings derived from its conduct are limited, and Shannon & Wilson and EHSI cannot know or state for an absolute fact that a site is unaffected by reportable quantities of regulated contaminants. Furthermore, even if Shannon & Wilson and EHSI believe that reportable quantities of regulated contaminants are not

present, Sound Transit still bears the risk that such contaminants may be present or may migrate to the site after the study is complete.

Shannon & Wilson and EHSI have reviewed historical records of the subject parcel. We have examined and relied on documents referenced in the report and on oral statements made by certain individuals. Shannon & Wilson and EHSI have not conducted an independent examination of the facts contained in referenced materials and statements. We have assumed that these documents are genuine and that the information provided in these documents and statements is true and accurate. We have no knowledge or indication to the contrary unless otherwise stated in the body of the report.

Shannon & Wilson and EHSI have prepared this report in a professional manner, using that level of skill and care normally exercised for similar projects under similar conditions by reputable and competent environmental consultants currently practicing in the area, and in accordance with the terms and conditions set forth in our contract and Work Directive #14. Shannon & Wilson and EHSI are not responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time the report was prepared. Also note that the facts and conditions referenced in this report may change over time and that the conclusions set forth here are applicable to the facts and conditions as described only at the time of this report. Conclusions were made within the operative constraints of the scope, budget, and schedule for this project. We believe that the conditions stated here are factual, but no guarantee is made or implied.

This report is for the exclusive use of Sound Transit and its representatives. Shannon & Wilson has prepared Appendix G, "Important Information About Your Environmental Site Assessment/Evaluation Report," to help you and others understand the use and limitations of our reports.

CERTIFICATIONS, SIGNATURES, AND CREDENTIALS

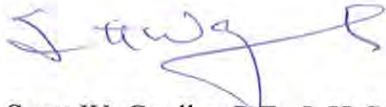

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in the Code of Federal Regulations Title 40, Part 312. We have the specific qualifications based on education, training, and experience to assess a property of this nature, history, and setting of the subject parcel.

This Environmental Site Assessment was performed by:

Kurt Easthouse, L.G., L.H.G., R.G.
Principal Hydrogeologist

Mr. Easthouse is a Principal Hydrogeologist at EHSI, and has reviewed this report for technical content. He is a Professional Geologist and Hydrogeologist with over 27 years of experience characterizing and remediating environmental contamination.

Scott W. Gaulke, P.E., L.H.G.
Vice President

Mr. Scott W. Gaulke, a Vice President at Shannon & Wilson, Inc., reviewed this Phase I ESA for completeness and technical accuracy. Mr. Gaulke is a Professional Engineer with over 25 years of experience conducting Phase I ESAs and other environmental assessments.

APPENDIX C
SITE VISIT CHECKLIST

Date: 10-23-14 Arrival Time: 8am Departure Time: 1pm
Weather Conditions: overcast, light rain
Inspector (name, title): Lisa Kellarsch, Senior Env. Scientist
Site Contact (name, title): receptionists at The Wall Dr + Crossfit 425

The source (name, agency, publication) of all data should be provided with the data.

I. Physical Site Description

Facility/Project Names: Ceugā (EL 296)

Address: 1606 130th Ave NE

City, State, Zip: Belloune, WA 98005

County: King

Property Boundaries (street names, development, woods, lakes, etc.)

north chain link fence

south patch of landscaping with vegetation

east adjacent structure (Arnold's appliance)

west 130th Avenue NE

Methods of Investigation (walk, drive, perimeter, etc.): walking

Accessed/Did Not Access: Grand Event Rentals tenant space

II. General Physical Conditions

Size of Site (acres/sq. ft.): 51,250 ft²

Shape of Site: square

Number of Parcels: 1

Land Use

- Present Use (agriculture, residential, commercial, industrial): Commercial
- Zoned: BR-RC-1
- %Occupancy: 100%
- Tenant Life (use): Grand Event Rentals - at least 2008.
The Wall Doctor since at least 2013.
Crossfit 425 - unknown, no listings found in Cole Director
- Land Cover: parcel has asphalt parking and one structure
- Number of Buildings: 1
- Number of Stories: 1
- Age of Buildings: 1962
- Size of Buildings: 23,316 ft²
- Materials Building Constructed of: masonry, concrete slab foundation
- Condition and Cleanliness of Buildings and Surrounding Area (debris, dumps, equipment clutter): Crossfit 425 - fair to good.
The Wall Doctor - poor housekeeping, stains noted on walls and floors, multiple areas of cluttered chemical storage.
- Warnings, Notices and Permits Displayed (type): N/A
- Evidence of Past Use (disturbed areas/patched pavement/demolition remains): N/A

Odors

- Description (gasoline, paint; chemical): Chemical solvent smell
- Location: yellow flammable locker in office hallway

Spills

- Location: N/A
- Description (size, composition): N/A

Staining (on walls, ceilings, floors, ground, soil, etc.)

- Location: Paint booth, office hallway
- Color: Paint booth - white & gray, hall - multiple colors
- Description (size, composition): extensive throughout walls and floors. Splashes, stains, rust on all noted surfaces.

Vegetation

- Ground Cover (trees, grass, crops, bare): very limited landscaping at north, northwest and south boundaries.
- Discoloration (description/location/probable cause): N/A
- Bare Spots (location/probable cause): N/A
- Stunted Vegetation Growth (location/description): N/A

-
-
- Increased Vegetation Growth (location/description): N/A
-

Topography

- Relief (flat, gently rolling, sloping, hilly, karst): relatively flat with gentle southward sloping
- Regional and Local Slope: south
- Elevation: ~195 feet
- Depression/pits/lagoons (description/location): N/A
- Evidence of Fill (changed topography, immature vegetation, mining activities- description/location): N/A
- Source of Fill (source of information): N/A

Hydrology

- Ponds, Streams, Ditches, etc.. (Location, direction, distance): Boff creek is approximately 75 feet east and sub-grade.
- Wetlands (detailed study required?): N/A
- Source of Water (where water in streams, rivers, ditches is flowing from): from north
- Discharge Points of Water: Lake Washington

- Site Receives /surface Water Run-off from (direction): north
- Run-off from Site Flows to (direction into inlets, street, adjacent land):
storm water drains on site and south-southwest
- Wastewater Discharge: City of Bellevue
- Flood Plain: _____

Geology and Hydrogeology (Record Review)

- Soil Type (clay, sand, loam): sand, silt and gravel
- Drainage: (good, fair, poor): fair
- Dept of Bedrock: unknown
- Groundwater Depth/Flow Direction: inferred south-southwest

III. Storage

USTs

- Evidence of On-Site/Adjacent Site USTS's (pipes, vents, pump islands, fill caps, patching): NIA
- Monitor Systems (location): NIA
- Contents: NIA

- Tank ID #: NIA
- Size: NIA
- Age: NIA
- Tank Type (steel, fiberglass, composite): NIA
- Records (tightness, testing, inventory): NIA

ASTs

- Location: NIA
- Contents: NIA
- Age/Condition of Tank/Type of Tank/Size: NIA
- Evidence of Spills/Leaks/Containment: NIA

IV. PCBs (Transformers, florescent light ballasts, hydraulic lifts)

Type/Number of Equipment: fluorescent lights and HID lights
ID#: NIA
Labeled: NIA
Location: interior and exterior of building
Condition of Units: fair
Condition of Surroundings: N/A
Owner of Units: Elifa LLC
PCB Content: unknown

V. Equipment Used On Site

Type of Equipment (processing, maintenance): paint booth, carpentry
power tools

Location: The Well Doctor, Inc.

Chemicals Used by Equipment (process): paint, paint thinner,
vamish and stain remover, wood glue

Chemicals Used in Cleaning Equipment (maintenance): Dixey spray
surface cleanser

Cleanliness/Upkeep of Equipment: fair - equipment was dusty,
air filters noted to be dirty.

VI. Utilities (include name of public utility)

City/Well Water (age/test results): City of Bellevue

Sewer Water (leach field, dry wells, age): City of Bellevue

Septic System (tiles or leach field/age/records): N/A

On-Site Treatment Facility (lagoons, ponds, age/records): N/A

Power (company name/age): PSE

Natural Gas (age): PSE

VII. Waste and Chemical Handling

Size/numbers/Type of Storage Containers: 3-55 gallon drums for waste storage, multiple cans (~1gallon) in paint booth

Location: office hallway, paint booth

Contents: waste drums - Soluene/acetone, Latex paint, glue

Condition of Containers (covered, labeled, corroded): drums were not securely closed, were rusted and stained

Disposal Methods (who/frequency): Emerald Services, as needed

Spills/Leaks: multiple cans appeared to have spilled

On-Site Chemicals (MSDS) (get copies): not noted

Purpose of Chemicals (process, cleaning): Carpentry services

Use of Herbicides or Pesticides: unknown

VIII. ACMs

ACM Inspector: N/A

Suspect ACMs Observed: N/A

Condition: N/A

Classification: N/A

Location: NIA

Quantity: NIA

IX. Lead/Lead in Paint

Lead in Paint Inspector: NIA

Maps Checked: NIA

Agency Personnel, Records, Surveys: NIA

Samples (number, location, date, method): NIA

Maps Checked: NIA

Agency Sources, etc.: NIA

Maps Checked: NIA

Agency Sources, etc.: NIA

X. Wetlands/Seismic/Oil and Gas/Hydro geologic/Transmission Tower

Maps, Agency Personnel, Records, Surveys Checked: NIA

Description (reported/observed): NIA

XI. Adjacent Land Use

Property Use (north): Airphone

Property Use (south): Holley's Autobody

Property Use (east): Arnold's Appliance

Property Use (west): 130th Ave NE with the Cadman quarry beyond.

Potential Concerns (USTs, ASTs, spills, operations, age): Cadman quarry has history of petroleum spills.

XII. Past Use of Property and Surrounding Area

Topography: commercial development, sloping south.

USTs (for on-site USTs include all information): Cadman property - removed

ASTs (include all information): Cadman property - removed

Solid/Hazardous Waste: N/A

Spills and Leaks: Petroleum

XIII. Interviews

Property Owner/Tenant (name): N/A

Adjacent Properties: interviews with adjacent property owners (EC 297, 299, 295 and 290) are included in corresponding site reports.

Local Regulatory: dept. of Ecology file review

XIV. Miscellaneous Information

Closest transformer was off site at southeast end of Cadman quarry along 130th ave NE. Transformer is pole mounted

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

EASTLINK E340 CORRIDOR
BELLEVUE, WA 98005

COORDINATES

Latitude (North): 47.6249000 - 47° 37' 29.64"
Longitude (West): 122.1671000 - 122° 10' 1.56"
Universal Transverse Mercator: Zone 10
UTM X (Meters): 562581.4
UTM Y (Meters): 5274728.0
Elevation: 196 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site List

CERC-NFRAP: A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> KING, WA	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map
---	--

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> KIRKLAND	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
--	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/8 - 1/4 Mile WSW
Site Name:	BELLEVUE PLATING CO INC
Site EPA ID Number:	WAD078194107
Groundwater Flow Direction:	NOT AVAILABLE
Inferred Depth to Water:	15 feet to 25 feet
Hydraulic Connection:	The uppermost water-bearing strata is a glacial drift composed of sands, gravel, and clay with lenses of consolidated till.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>

23	1/2 - 1 Mile SE	NW

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Everett

Soil Surface Texture: gravelly sandy loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	16 inches	gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 6.5 Min: 5.1
2	16 inches	31 inches	very gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 141 Min: 42	Max: 6.5 Min: 5.1
3	31 inches	59 inches	very gravelly coarse sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Clean gravels, Poorly Graded Gravel. COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel.	Max: 705 Min: 141	Max: 6.5 Min: 5.6

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: Alderwood

Soil Surface Texture: gravelly sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 84 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	11 inches	gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 42 Min: 14	Max: 6 Min: 5.1
2	11 inches	26 inches	very gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 42 Min: 14	Max: 6 Min: 5.1
3	26 inches	59 inches	very gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 0.42 Min: 0.01	Max: 6 Min: 5.1

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 3

Soil Component Name: Indianola

Soil Surface Texture: loamy fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	5 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 6.5 Min: 6.1
2	5 inches	29 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6.5 Min: 6.1
3	29 inches	59 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 705 Min: 141	Max: 6.5 Min: 6.1

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)

Source: United States Geologic Survey

A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Wells

Source: Department of Health

Telephone: 360-236-3148

Group A and B well locations.

Water Well Listing

Source: Public Utility District

Telephone: 206-779-7656

A listing of water well locations in Kitsap County.

OTHER STATE DATABASE INFORMATION

Oil and Gas Well Listing

Source: Department of Natural Resources

Telephone: 360-902-1450

Locations that represent oil and gas test well sites in Washington State from 1890 to present.

RADON

Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

<u>Lower Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
BELLEVUE PLATING CO INC	1513 128TH PL NE	0 - 1/8 (0.000 mi.)	D70	118

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/11/2014 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/11/2014 has revealed that there are 11 RCRA-CESQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

State- and tribal - equivalent CERCLIS

CSCSL: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Ecology's Confirmed & Suspected Contaminated Sites List.

A review of the CSCSL list, as provided by EDR, and dated 07/21/2014 has revealed that there are 31 CSCSL sites within approximately 1 mile of the target property.

State and tribal voluntary cleanup sites

ICR: These are remedial action reports Ecology has received from either the owner or operator of the site. These actions have been conducted without department oversight or approval and are not under an order or decree.

A review of the ICR list, as provided by EDR, and dated 12/01/2002 has revealed that there are 32 ICR sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

CSCSL NFA: The data set contains information about sites previously on the Confirmed and Suspected Contaminated Sites list that have received a No Further Action (NFA) determination. Because it is necessary to maintain historical records of sites that have been investigated and cleaned up, sites are not deleted from the database when cleanup activities are completed. Instead a No Further Action code is entered based upon the type of NFA determination the site received.

A review of the CSCSL NFA list, as provided by EDR, and dated 07/21/2014 has revealed that there are 24 CSCSL NFA sites within approximately 0.5 miles of the target property.

Records of Emergency Release Reports

SPILLS: Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

A review of the SPILLS list, as provided by EDR, and dated 06/12/2014 has revealed that there are 3 SPILLS sites within approximately 0.001 miles of the target property.

EXECUTIVE SUMMARY

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/11/2014 has revealed that there are 72 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

FTTS: FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act) over the previous five years. To maintain currency, EDR contacts the Agency on a quarterly basis.

A review of the FTTS list, as provided by EDR, and dated 04/09/2009 has revealed that there is 1 FTTS site within approximately 0.001 miles of the target property.

PURUS TECHNOLOGIES INC	1720 130TH AVE NE SUIT	0 - 1/8 (0.000 mi.)	H95	155

HIST FTTS: A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

A review of the HIST FTTS list, as provided by EDR, and dated 10/19/2006 has revealed that there is 1

EXECUTIVE SUMMARY

HIST FTTS site within approximately 0.001 miles of the target property.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 11/18/2013 has revealed that there are 37 FINDS sites within approximately 0.001 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 55 EDR US Hist Auto Stat sites within approximately 0.25 miles of the target property.

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 6 EDR US Hist Cleaners sites within approximately 0.25 miles of the target property.

EDR RECOVERED GOVERNMENT ARCHIVES

Exclusive Recovered Govt. Archives

RGA LUST: The EDR Recovered Government Archive Leaking Underground Storage Tank database provides a list of LUST incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the Department of Ecology in Washington.

A review of the RGA LUST list, as provided by EDR, has revealed that there are 2 RGA LUST sites within approximately 0.001 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>

Registry ID: 110005334316

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Classification: Non-Generator
Description: Handler: Non-Generators do not presently generate hazardous waste

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
Used oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:

Date form received by agency: 12/31/2007
Site name: BELLEVUE AUTO REBUILD INC
Classification: Not a generator, verified

Date form received by agency: 12/31/2005
Site name: BELLEVUE AUTO REBUILD INC
Classification: Small Quantity Generator

Date form received by agency: 12/31/2003
Site name: BELLEVUE AUTO REBUILD INC
Classification: Small Quantity Generator

Facility Has Received Notices of Violations:

Regulation violated: Not reported
Area of violation: Generators - General
Date violation determined: 08/01/1984
Date achieved compliance: 07/04/1994
Violation lead agency: State
Enforcement action: WRITTEN INFORMAL

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Waste code: D039
Waste name: TETRACHLOROETHYLENE

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit

Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
