INTRODUCTION

Background and Purpose

The City of Bellevue commissioned Community Attributes Inc. (CAI) in 2023 to perform economic analysis pertinent to a proposed land use code amendment (LUCA) in the Wilburton Commercial Area of Bellevue. In 2018, a 15-member Citizen Advisory Committee submitted a report for its vision on land use, transportation, and urban design called the Wilburton Vision. In 2022, Bellevue City Council authorized the implementation of this vision, for which the findings from the LUCA for the Wilburton Transit Oriented Development (TOD) area would support a rezoning, to transform the area into a vibrant transit-oriented urban neighborhood in Bellevue. Through this process, CAI delivered technical and economic analysis summarizing stakeholder feedback as well as providing data on current market conditions and development economics to inform land use and policy considerations.

As a part of the LUCA process, the City of Bellevue is also exploring a range of voluntary and mandatory affordable housing policies. Among these is a mandatory affordable housing performance and in-lieu fee program. The City of Bellevue contracted CAI to provide an affordable housing nexus study. The purpose of a nexus study is to demonstrate the extent that new development generates need for affordable housing and the proportionate impact of different types of development on the need for affordable housing. This nexus study provides the maximum supportable residential and nonresidential in-lieu fees and on-site affordable housing performance requirements for the range of development types anticipated within the Wilburton Commercial Area.

Methods and Approach

Data used in this report draws from several sources, including American Community Survey (ACS) and American Housing Survey (AHS) demographic data published by the U.S. Census Bureau, national real estate listing sites such as Zillow and Redfin, statewide and regional housing and population data provided by the Office of Financial Management (OFM), Puget Sound Regional Council, and the U.S. Bureau of Labor Statistics (BLS). Jobs supported by new development, including direct, indirect, and induced jobs by prototype were generated by using IMPLAN (Impact Analysis for Planning), a software provider that calculates projected economic impacts and multipliers by employment industry.

This report uses a similar methodology as the Seattle Affordable Housing Nexus Study and Economic Impact Analysis completed in 2015 for the City of Seattle. Similar studies have been used in other states, including California, Colorado, Massachusetts, Minnesota, and Wyoming. Analysis throughout this

report uses development types specific to Bellevue and Wilburton, and where possible, data specific to these areas.

Organization of Report

The remainder of this report is organized as follows:

- **Prototype Details** describes the variety of mixed-use residential and commercial prototypes that the City of Bellevue anticipates will be developed in the Wilburton area, and, as such, that are subject to this study.
- **Affordability Gap Analysis** summarizes the calculation of the affordability gap and documents inputs and assumptions used throughout the analysis.
- **Calculation of Nexus Fees** presents a detailed summary of the calculations for residential and nonresidential maximum supportable in-lieu fee and on-site performance requirement.
- **Conclusion** includes a summary of key findings.
- **Appendices** include supporting exhibits and findings for nexus calculations.

PROTOTYPE DETAILS

This study presents analysis for four unique rental and ownership residential prototypes (profiles of eight development types in total), that most closely represent the anticipated development types that will be constructed in the Wilburton subarea of Bellevue given the anticipated zoning changes. The four different building types include Mixed Use High-Rise 20-Story, Mixed-Use Mid-Rise, Mixed-Use High-Rise 13-Story and Urban Core.

Exhibit 1 and **Exhibit 2** display key prototype metrics, including the total number of residential units, building height in stories, net floor area, net square feet per unit, and unit breakdown by prototype and bedroom type.

Exhibit 1. Prototype Details & Unit Count, Wilburton, City of Bellevue

Rental Prototypes				
Prototype	# Units	# Stories	Net Floor Area	Net Square Feet per Unit
Prototype 1 - Mixed-Use High-Rise 20-Story	880	20	624,750	710
Prototype 2 - Mixed-Use Mid-Rise	140	6	110,670	791
Prototype 3 - Mixed-Use High-Rise 13-Story	770	13	560,788	728
Prototype 4 - Urban Core	1,670	37	1,155,788	692
Ownership Prototypes				
Prototype	# Units	# Stories	Net Floor Area	Net Square Feet per Unit
Prototype 5 - Mixed-Use High-Rise 20-Story	880	20	624,750	710
Prototype 6 - Mixed-Use Mid-Rise	140	6	110,670	791
Prototype 7 - Mixed-Use High-Rise 13-Story	770	13	560,788	728
Prototype 8 - Urban Core	1,670	37	1,155,788	692

AFFORDABILITY GAP ANALYSIS

Calculating the per unit affordability gap, or the difference between expected rent or sales value and the cost to construct and operate an affordable unit, is the first step in the nexus analysis. The affordability gap is used with an estimate of affordable unit demand to estimate the maximum supportable affordable housing in-lieu fee. The affordability gap is calculated at each level of area median income (AMI) by unit size based on number of bedrooms, summarized to the average affordability gap by AMI level.

The following data points and inputs are used in the calculation of affordability gap by AMI level:

- Income limits by AMI level and household size are sourced from A Regional Coalition for Housing (ARCH).
- Renter utility allowances are also sourced from ARCH.
- Development assumptions such as vacancy rate and average development cost per net square foot were sourced from the market analysis conducted in support of the Wilburton LUCA
- Operating cost per unit per year was informed through feedback from ARCH

Additional assumptions used in the affordability gap calculation for ownership units include vacancy rate, operating cost per unit per year, mortgage interest rate, mortgage amortization, development cost per net square foot, and affordable housing expense as a percentage of income.

Exhibit 3 through **Exhibit 5** show all pertinent inputs and market data utilized to inform the affordability gap calculations for this study. In parallel with the methodology used in the 2015 City of Seattle Nexus Study, no leverage (e.g., tax credits) was assumed throughout the entirety of the analysis.

Exhibit 3. Affordable Housing Income Limits by AMI & Household Size

Household Size	30% AMI	50% AMI	60% AMI	80% AMI	100% AMI
One Person	\$30,954	\$51,590	\$61,908	\$82,544	\$103,180
Two Persons	\$35,376	\$58,960	\$70,752	\$94,336	\$117,920
Three Persons	\$39,798	\$66,330	\$79,596	\$106,128	\$132,660
Four Persons	\$44,220	\$73,700	\$88,440	\$117,920	\$147,400
Five Persons	\$47,758	\$79,596	\$95,515	\$127,354	\$159,192
Six Persons	\$51,295	\$85,492	\$102,590	\$136,787	\$170,984

Sources: ARCH, 2024; CAI, 2025.

Exhibit 4. Affordability Gap Analysis Assumptions, Wilburton, City of Bellevue

Assumptions	Value
Vacancy rate	5%
Operating cost per unit per year	\$7,500
Development cost per NSF (Mid-Rise)	\$314

Source(s): ARCH, 2024; CAI, 2025.

Note: The development cost for Urban Core and Mixed-Use High-Rise prototypes is assumed to be \$468 per net square foot (NSF). In the instance where the \$468/NSF development cost figure is substituted for \$314/NSF for the high-rise prototypes, the maximum supportable residential fees increase at every AMI range, and are more than double the value at the “Below 100% AMI” level when using the \$314/NSF cost figure. Furthermore, the maximum supportable commercial fee at the “Below 100% AMI” level more than doubles for both prototypes, and increases across every AMI cohort. Similarly, in the alternative commercial fee analysis, the maximum supportable commercial fee at the “Below 100% AMI” level nearly doubles for each of the four prototypes.

Exhibit 5. Household Size Assumptions, Renter Utility Allowance and Development Cost by Size of Unit, City of Bellevue

Assumptions	Studio	1 Bedroom	2 Bedroom
Household Size	1	1.5	3
Renter Utility allowance - tenant pays all utilities	\$189	\$231	\$287
Average Unit Size (Net Square Feet)	550	700	900
Average Development Cost per Unit	\$172,700	\$219,800	\$282,600

Sources: ARCH, 2024; 2023 Seattle Household Demographics, All Occupied Units, American Housing Survey, U.S. Census Bureau; CAI, 2025.

Income limits by AMI level are available by the number of persons per household. These assumptions are converted to household size by number of units, assuming one person for a studio unit ranging to 6 persons on average for a four-bedroom unit. Income limits are prorated for 1.5 person households, assumed for one-bedroom units. Renter utility allowances are also based on the size of unit (**Exhibit 5**).

Assuming renters will spend 30% of their gross income on rent, an affordable monthly housing expense was calculated for each bedroom type at all AMI levels. The monthly utility allowance was then subtracted from this figure to yield an affordable monthly rent figure, which was then multiplied by 12 to return an annual gross rental income per unit.

Annual gross rental income was reduced by an assumed vacancy rate of 5% and annual operating costs, assumed at \$7,500 per unit, resulting in net operating income (NOI) per unit. In order to compare NOI to the development costs, NOI is converted to a supportable mortgage per unit. The supportable mortgage is calculated by taking the calculated net operating income per unit, as shown in **Exhibit 6**, at each bedroom size and dividing that number by the interest rate of 7.00% to yield a supportable mortgage per unit figure.

The affordability gap per unit was determined by subtracting the supportable mortgage from the estimated development costs for both mid-rise and high-rise prototypes for each unit size. Where the NOI per unit and supportable mortgage per unit were negative, the affordability gap was set equal to the total development cost. Lastly, the average affordability gap at each AMI level is estimated based on the assumed unit mix, or the percentage of total units attributed to each unit size, representing an average affordable housing unit at each AMI level. (see **Exhibit 6** through **Exhibit 10**)

Exhibit 6 through **Exhibit 10** show that there is a more significant affordability gap at lower AMI levels, with there being a more than \$211,000 difference between the average affordability gap at the 30% AMI level compared to the gap at the 100% AMI threshold, assuming development costs are \$314 per square foot.

Exhibit 6. Affordability Gap for 30% AMI Units, City of Bellevue

Affordability Gap for 30% AMI Units	Studio	1 Bedroom	2 Bedroom
Annual income limit	\$30,954.00	\$33,165.00	\$39,798.00
Affordable monthly housing expense	\$773.85	\$829.13	\$994.95
Less: Monthly Utility Allowance	(\$189.00)	(\$231.00)	(\$287.00)
Affordable Monthly Rent	\$584.85	\$598.13	\$707.95

CALCULATION OF NEXUS FEES

Residential Calculations

Residential nexus fee calculations include the following steps, explained in more detail in subsequent sections.

1. Estimate total household disposable income by prototype
2. Estimate jobs (full-time equivalent) supported by household disposable income
3. Estimate demand for affordable housing supported by jobs

Disposable Income

Estimating the total household disposable income by prototype is the first step in the residential affordable housing nexus calculations. This process starts by collecting market rate rent and sales data for existing units in Bellevue within developments that are comparable with each prototype.

Assumptions on housing costs are documented in

Exhibit 11. Exhibit 12 shows the household disposable income calculations for ownership prototypes. For ownership prototypes the analysis process uses market rate sales prices and assumptions to calculate mortgage for an average unit per prototype. The monthly mortgage payment is combined with property taxes, insurance and other homeownership costs to estimate monthly housing costs. Assuming housing costs represent 30% of household income, monthly housing costs are converted to estimated disposable household income.

Exhibit 13 presents calculations for disposable household income for rental units. Average monthly rents are converted to total disposable household income assuming housing costs represent 30% of total household income.

Exhibit 11. Ownership Prototype Assumptions, Wilburton, City of Bellevue

Category	Assumptions
Down Payment	20%
Mortgage as % of sale price	80%
Mortgage Loan Term (years)	30
Interest Rate	7.00%
Mortgage expense as % of gross monthly income	30%
Assessed Value as a % of Sales Price	88.3%
2024 Bellevue Property Tax Levy (\$/1,000 AV)	7.8088
Average Monthly HOA	\$194.80
Average Monthly Insurance	\$161.30

Full Time Equivalents Supported by Disposable Income

Total disposable household income per prototype is inputted into IMPLAN to estimate the total number of full-time equivalents (FTE) supported by new residential market rate housing. **Exhibit 14** shows the disposable income value input into IMPLAN for each prototype, and the average annual income range for each. IMPLAN analysis yields estimated jobs by industry¹ in King County for each prototype. **Exhibit 45** and

Exhibit 46, in the **Appendix**, show the FTEs for each prototype summarized by industry. and added the total of FTEs generated by each development type at each two-digit North American Industry Classification System (NAICS) code.

¹ IMPLAN provides output for their 546 industry codes. These industry codes are matched to the North American Industry Classification System (NAICS) codes for use in this analysis.

Exhibit 14. IMPLAN Income Band by Prototype, Wilburton, City of Bellevue

Prototype	Specification	Value (Disposable Income)
Mixed-Use High-Rise 20-Story - Ownership	Households earning between \$150k-\$200k	\$169,598,134.05
Mixed-Use Mid-Rise - Ownership	Households earning between \$150k-\$200k	\$21,984,960.39
Mixed-Use High-Rise 13-Story - Ownership	Households earning between \$150k-\$200k	\$145,191,944.85

Affordable Housing Demand

FTEs supported by the disposable household income of new residential development are converted to households by AMI level to provide an estimate of demand for affordable housing generated by new market rate residential development. This analysis involves a series of steps.

First, the number of FTEs by industry generated by each prototype is converted to the number of households, assuming 1.60 workers per worker household. The number of workers per household is based on 2023 ACS 5-Year Estimates for the City of Bellevue. The number of worker households is multiplied by the percentage of households by industry level within each AMI level resulting in an estimate of the number of households by AMI level, including those that qualify for affordable housing (**Exhibit 15**).

The percentage of households by industry and AMI level uses two data sources: wages by occupation for the Seattle MSA from the Bureau of Labor Statistics and the industry occupation matrix for King County from the Washington State Employment Security Department. Wages by occupation are broken out by percentile. Combining wages by percentile and income limits by AMI level results in an estimate of the distribution of jobs by AMI level for each occupation. Multiplying this distribution by the percentage of each occupation within an industry results in an estimate of the distribution of jobs by AMI level for each occupation.

Exhibit 16 through **Exhibit 25** present the estimated number of households by industry, prototype and AMI level.

Maximum Supportable Nexus Fee

Exhibit 26 through **Exhibit 29** present the calculations for the maximum supportable nexus fee for each prototype by AMI level. The number of new households at each AMI level is multiplied by the affordability gap at each AMI level, resulting in the total affordable housing gap cost. The maximum supportable nexus fee per unit at each AMI level is calculated by dividing the total affordable housing gap cost by the number of units for each prototype. To achieve the supportable nexus fee per square foot at each AMI level, the calculated supportable nexus fee per unit is divided by the average unit size in square feet. The maximum supportable on-site performance requirement is calculated by dividing the number of new households at each AMI level by the total number of units for each prototype. The maximum supportable fee by AMI level is additive, for example, for example the maximum supportable fee for affordable housing units below 50% AMI is the sum of the fee at below 30% AMI and between 30%-50% AMI.

Exhibit 30 and **Exhibit 31** present the maximum supportable on-site affordable housing performance and in-lieu fees for residential prototypes. The results are shown at each AMI level and combined at below 80% AMI and below 100% AMI.

Non-Residential/Commercial Calculations

The following steps describe the process for calculating Nonresidential nexus fees, and are explained in more detail in subsequent sections.

1. Estimate The Total New Employee Households Generated by Nonresidential Prototypes
2. Distribute Household Generation by Prototype and Occupational Category
3. Estimate The Number of Households Generated by Nonresidential Prototype at Each AMI Level

New Employee Household Generation

To estimate the supportable nexus fee per-square-foot for all nonresidential prototypes, the number of new employee households generated by nonresidential prototype was calculated. To do this, an average employment density by square foot was determined for all prototypes, which was calculated by taking the total Wilburton Nonresidential Capacity figure of 12,000,000 square feet, and dividing that by the Wilburton Employment Capacity of 35,500, both figures which were derived from the 2024-2044 Comprehensive Plan Periodic Update and Wilburton Vision Implementation Final EIS February 2024. Utilizing the pre-determined nonresidential totals for each prototype, an estimated total number of employees generated by prototype was calculated by dividing this total nonresidential square footage by the employment density factor of approximately 338 by prototype (**Exhibit 32**).

To estimate the number of new employees who will be living in the City of Bellevue as generated by each prototype, the current employee base living in Bellevue was divided by the total number of employees currently working in the City, equal to 57.5% of all workers. The number of workers per worker household in the City was then calculated by dividing the total number of Bellevue City residents who are employed by the number of households with at least one worker, equal to 1.60 workers per worker household. **Exhibit 32** shows the estimated number of employees living in Bellevue by prototype, and the resulting number of employee households the City will absorb upon the development of each prototype. **Exhibit 33** shows an alternative approach to the nonresidential calculations, using employment density estimates.

Distribution by Occupation

After having calculated employment totals for the City of Bellevue by both two-digit SOC and NAICS codes (*methodology described in [Residential Calculations](#) section*), a weighted average occupational distribution was calculated by two-digit SOC code, which compares these weighted employment distributions to the percentage of income that falls within each AMI bracket (**Exhibit 34**). Each SOC category shows the percentage of income for each occupation that falls within each AMI level. Of all 22 occupational categories, more than 50% of that occupation's wages fell between either 30% and 50% AMI, or greater than 100% of AMI for 16 occupations.

Maximum Supportable Nexus Fee

Exhibit 35 through **Exhibit 42** present the calculations for the maximum supportable nexus fee for each nonresidential prototype by AMI level. The number of new households at each AMI level is multiplied by the affordable housing at each AMI level, resulting in the total affordable housing gap cost. The maximum supportable fee at each AMI level is calculated by dividing the total affordable housing gap cost by the total nonresidential square footage.

Exhibit 43 presents the maximum supportable commercial nexus fees by nonresidential prototype. Again, these results are shown at each AMI level and combined at below 80% AMI and below 100% AMI. **Exhibit 44** shows the maximum supportable commercial nexus fees by alternative nonresidential prototype.
